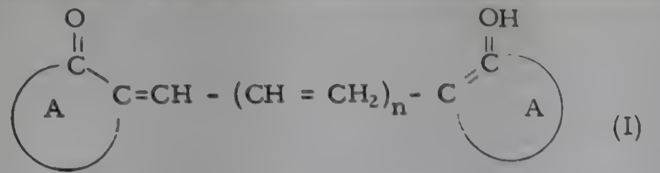
Staining of fabrics by fugitive dyes such as tea, coffee, wine and fruit stains are prevented, without damage to fabrics. 18.6.76 (8pp931)

YGOS ★ D25 18688B/10 ★J5 4011-106

Detergent compsns. - contg. bis-pyrazolone cpd. colourant, bactericide or disinfectant, pH controller, perfume, surfactant, chelating agent, etc.

YAMAMOTO KAGAKU GOS KK (SAKI) 28.06.77-JA-077463
A97 E23 (27.01.79) C11d-03/40

Detergent compsn. comprises (a) $\geqslant$1 colourant of formula (I); (b) a bactericide or disinfectant (which does not destroy the colourant, e.g. quat. ammonium salt such as benzyltrimethyl ammonium chloride, organic sulphur disinfectant such as tetramethylthiuram, or organic nitrogen disinfectants such as sodium azide; (c) a pH controller; (d) perfume; (e) surface active agent; (f) chelating agent; (g) excipient; and (h) filler.



(I)

In the formula, ring A represents 1-phenyl-3-substituted-5-pyrazolone ring where the phenyl group at 1-position represents sulphonate or carboxylate salted with an alkali(ne earth) metal ammonium or a lower alkyl ammonium and ≥1 carboxylic acid group which may be coupled with the phenyl gp. and the subst. at 3-position represents a lower alkyl, carbonyl or lower alkoxycarbonyl group and a methine group is coupled at 4-position which may be substituted by a lower alkyl group and is zero, 1 or 2. 28.6.77. as 077463 (11pp59)

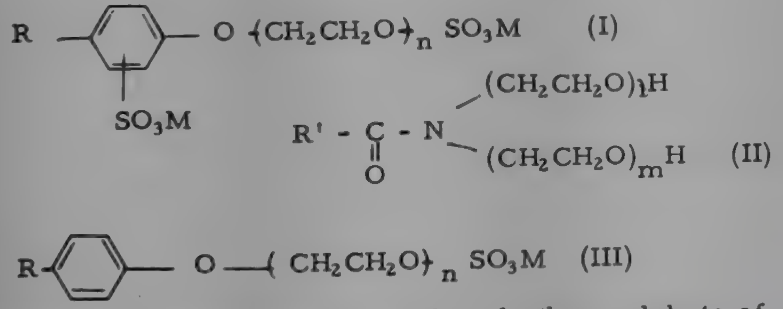
A25 E12 (A97) (01.02.79) C11d-01/29 C11d-03/04 C11d-10/02

Liq. detergent compsns. comprise (a) 1-10 wt.% anionic surfactant contg. ≥40 wt.% of a polyoxyethylene-alkyl-phenyl ether sulphate of formula (I) opt. in combination with a polyethylene-alkylphenyl ether sulphate of formula (III); (b) 2-5 wt.% caustic alkali and (c) 5-15 wt.% polyethylene-alkylamide of formula (II).



(I) (II) (III)

In the formulae 5-15C straight or branched chained alkyl, n is 3-15; M is Na or K; R' is 9-17C straight or branched chained alkyl, l and m are each > 1 and (l + m) is about 3-12.

The liquid compsns. can remove fouling produced by oxidn. or resinification of lubricating oil, surface active agents, fats, etc. under heating and have long storage life. 1.7.77. as 078901 (4pp59)

KAOS ★ D25 19349B/10 ★J5 4014-386

Nonionic oxyalkylene surfactant used esp. for emulsion polymerisation - is derived from a poly:hydric alcohol and has only one ether linkage

KAO SOAP KK 05.07.77-JA-080093

A97 E17 (02.02.79) B01f-17/42 C07c-43/04 C08f-02/30 C11d-01/72

A nonionic surfactant comprises a cpd. derived from a polyhydric alcohol and having only ether linkage of formula $M\left[O\{AO\}_m R\right]_n$ (I). In (I) M is a polyhydric alcohol residue having 6 hydroxyl gps. per one molecule, AO is oxyethylene gp. or oxypropylene gp., n is 3-8, m 1-50, n x m is between 1 and 150, and R is H or 8-24 C satd. or unsatd. alkyl and ≥1 of nR gps. is alkyl. The cpds. include the sesqui-lauryl ether of polyoxyethylene(contg. 40 oxyethylene gps) sorbitol, sesquistearyl ether of polyoxyethylene (contg. 60 oxyethylene gps.) sorbitol etc.

The surfactant, having a characteristic chemical structure, e.g., a number of alkyl gps. and a variety of hydrophilic gps, has a great power to emulsify, disperse, and dissolve substances, partic. exhibits a greater emulsi- in the emulsion polymerisation of ethylenic

(5pp117)

DOTH/ ★ D25 B/10 ★J5 4014-406

Detergent compsn.

(02.02.79)

12.4.78. as 043074

AIRL D25 72912A/41 =NL-159-352

Stable sodium percarbonate prepn. - by contacting aq. hydrogen peroxide with saturated sodium carbonate pre-purified by caustic soda and salt addn.

AIR LIQUIDE L' 19.01.67-FR-091689

*E34 (15.02.79) *DS1667-801 C01b-15/10*

Sodium percarbonate is prepd. by a continuous recirculation reaction from a sodium carbonate soln., which opt. contains bicarbonate but from which heavy metals have been removed, and a 30-90 wt.% H_2O_2 soln.

The conc. soln. of sodium carbonate is first treated with an excess of ≯50 mol.% NaOH (based on the amt. required for converting bicarbonate to carbonate), and 0.1-3 mol.% (based on sodium carbonate) of a soluble Mg, Ca or Zn salt. The soln. is filtered, and H_2O_2 soln. added at 30-40°C. Sodium percarbonate is crystallised out, and sepd., and the mother liquor recirculated.

Specifically 20 mol.% excess of NaOH is used, and 0.5 mol.% soluble metal salt is added. The sodium percarbonate is cropped after cooling the mother liquor to 10°C, and dried e.g. with air at 50°C in a fluidised bed. Good yields are obtd. 17.1.68. as 000744 (7pp913)

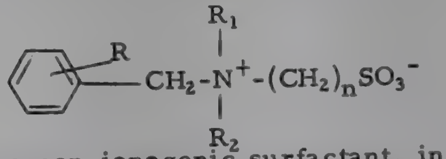
PROC D25 31202T/20 =NL-159-434

Detergent compsn - contng a zwitterionic cpd

PROCTER & GAMBLE CO 29.10.70-GB-051507

*E14 (15.02.79) *DT2153-477 C11d-01/92*

Washing agent comprises a mixt. of a sulphobetain (I)



(I)

and a non-ionogenic surfactant, in a wt. ratio of 9-1:1-9.

In the formula, R is 8-24C alkyl; R_1 and R_2 are 1-6C alkyl; and n is 1-4.

The combination of components impart properties such that much less strengthening agents (i.e. phosphates and strong chelating agents) are required, thus reducing the nutrient source for algae growth. If required, phosphates can be omitted entirely, thus eliminating a source of water-contamination. 28.10.71. as 014837 (7pp913)

AYRO- D25 16279S/09 =NL-159-435

In-situ cleaning and re-insulating of electric - generators etc

AYRODEV PROCESSES (AYR -) 22.08.69-NL-012821

*(15.02.79) *NL6912-821 C11d-07/50*

Electrical machines are cleaned using an agent comprising a cationic surfactant salt of an amine with a ≥12C hydrocarbyl residue and an organic acid, an aromatic hydroxy-acid or its ester, and an organic solvent. After cleaning the solvent is allowed to evaporate. Pref. the machine is then coated with an insulating varnish or other coating material.

Agent is esp. suitable for machines fouled with carbon-contg. material, salts, water etc. (i.e. on sea-going vessels). It does not impair the drying and hardening of insulating varnishes, as occurs using oil-based cleansers. 22.8.69. as 012821 (3pp913)

PROC D25 08409B/05 =US 4141-841

Antistatic, fabric softening detergent additive - contg. a quaternary ammonium salt, dispersion inhibitor and organic agglomerating agent

PROCTER & GAMBLE CO 18.07.77-US-816761

*E19 (27.02.79) *EP-----416 D06m-13/46*

Particulate detergent additive for preventing static build-up on textiles and softening fabrics when applied from a detergent wash liquor, is an agglomerate of 5-75 wt.% water-soluble neutral or alkaline salt; 5-75% particles being intimate mixt. of 80-20 wt.% of quat. ammonium cpd. $[R_1R_2R_3R_4N]^+Y^-$ where 1-2 R gp. is 16-22C aliphatic or 10-16C alkyl phenyl or alkyl benzyl, remainder R gps. being 1-4C alkyl, 2-4C hydroxyalkyl and cyclic structures contg. N, Y is anionic hydroxide, halide, sulphate, methylsulphate, ethylsulphate and phosphate ion; 20-80 wt.% dispersion inhibitor being solid organic material having max. solubility in water of 50ppm. at 25°C and softening point at 100-200°F; 5-75 wt.% organic agglomerating agent. Individual particles have size 10-50µ.

Compsn. may also contain certain types of smectite clay to enhance fabric-softening properties. 18.7.77 as 816761 (14pp931).

FARH D25 26933A/15 =US 4141-938
Mixed orthophosphate ester(s) prepn. - from phosphorus pentoxide, alcohol and poly:ol in defined ratio
HOECHST AG 07.10.76-DT-645211
*E11 H07 M12 (27.02.79) *BE-859-433 C07f-09/09*

Mixt. of acid phosphoric acid esters are prepd. where P_4O_{10} is reacted by mixing or kneading it with a blend contg. a monohydric alcohol and an alkane polyol contg. 2-12C and 2-6-OH gps. in molar ratio of P_4O_{10} to monohydric alcohol to alkane polyol of 1:2:4/n, n being no. of -OH gps. present in polyol.

Reaction is carried out at 0-120°C in the presence of inert gas over 1-6 hrs. and cooling resultant prod. Orthophosphoric acid esters are similarly prepd. by reacting phosphorous (V)-oxide with mixt. of monohydric and polyhydric alcohol under anhydrous conditions.

Prods. are used as acid cleaning compsns. for metals. Derivs. are used as emulsifiers, wetting agents, lubricants, antistatic agents or foam-regulating additives. 16.11.77 as 851944 (+ 3.10.77 - US - 838464) (6pp931).

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

D1: FOOD; FERMENTATION

D11: BAKING

BONG- ★ D11 20056B/11 ★BE -871-779
Bakery multi-tier electric oven of modular construction - is easily adapted for precise output and required power consumption
FILS BONGARD O CIE 18.05.78-FR-015659
Q74 (01.03.79) A21b F24d

An electric multitier oven is of modular construction, such that each cooking tier has corresp. heating elements. Pref. each modular element is provided on its surfaces against neighbouring elements, on the level with upper and lower sheets limiting the first and last cooking tiers, and with lateral sheets, with a folded sheet with holes for assembly bolts, a seal being inserted between adjacent modular elements. Pref. the intermediate sheets limiting the cooking area of each section are ribbed and identical, the troughs carrying heating elements and the summits supporting the piece to be cooked.

The oven is used for bakery prods., confectionery prods. etc. 6.11.78 as 871779 (10pp918)

GERD- D11 58932A/33 =DS 2704-432
Paste portioning device, esp. for pastry dough - having step-wise moving piston with pressing and locking means
GERDES & CO GMBH 03.02.77-DT-704432
*(08.03.79) *DT2704-432 A21c-05/02*

A hand press, for dispensing portions of dough and pasty material such as cream, has a piston indexing in a storage vessel. The piston has teeth with which a thruster and a locking device engage alternately. The thruster is coupled to an operating lever on a horizontal axis on the vessel and is spring-loaded.

The thruster is rigidly coupled to the lever, which is movable at right angles to the axis of the piston rod and spring-supported on it. 3.2.77. as 704432 (6pp160)

HAIN/ ★ D11 20096B/11 ★DS 2739-790
Stencilled dough shapes cutter - with stencil plate, parting plate and die plate
HAINLEIN K 03.09.77-DT-739790
(08.03.79) A21c-11/02

Pieces of starlike and other shapes are stencilled from a flat rolled dough by a stencil plate with cut-outs of the desired shape with turned-over cutting edges and by a parting plate. A die platen is used to remove the shapes from the stencil plate.

This deals even with very sticky types of dough and is suitable for use in small or medium as well as in mass-production establishments. 3.9.77. as 739790 (5pp39)

WERN ★ D11 20162B/11 ★DT 2738-737
Confectionery chamber in multistage baking oven - is adjustable in temperature independently of others in hot gas circuit (NL 1.3.79)
WERNER & PFLEIDERER 27.08.77-DT-738737
(08.03.79) A21b-01/40

The baking chambers arranged one above the other, for loading at the front side, in a multistage oven heated by circulating hot gases, have, superimposed, an additional baking chamber for use also for confectionery, which is loaded from the side. This additional chamber has a further loading opening at the front of the oven, and it can be connected by familiar means to the heat circulating system of the other chambers, to which it corresponds in plan and in height.

Permits the loading of both types of goods without the mutual interference of the personnel. The temp. of the additional chamber is completely controllable independently of the others, so that it can be used for baking bread also. This raises the output of a three-stage oven producing bread by $33^{1}/_{3}\%$. 27.8.77 as 738737 (8pp1045)

HAAG- ★ D11 20310B/11 ★DT 2838-430
Dough portion moulding machine - with piston proportioner and cowled belt conveyor moulding section (NL 7.3.79)
HAAGSE BAKKERIJMACH 05.09.77-NL-009766
(08.03.79) A21c-05/02

A dough portion dividing machine consists of a measuring section and a moulding section. In the former, a piston charges a cylinder which is lowered to discharge on a rising belt conveyor. The moulding element of the belt conveyor is an adjustable hood with an inverted Vee shape of increasing depth which has a self-centering effect on the dough portions.

The self-centring effect prevents premature smearing of the discharge box. The desired size of the portions can be easily adjusted. 2.9.78 as 838430 (13pp39)

Door for heat insulating cladding of waffle baker - is made from inorganic insulating plates requiring minimum opening space
HAAS F 30.04.75-OE-003337
*A88 Q43 Q47 +Q48 (14.03.79) *DT2616-511 A21b-03/02*

A chamber is heat-insulated using cladding of door assemblies, each door assembly having a door of a plate disposed on each side of a frame, the frame and plates being of heat insulating material. The door is mounted by two arms to the chamber. One end of each arm is pivotally attached to the door at an axis midway between two opposite edges, and the other ends carrying a pivot for mounting with respect to the chamber. The pivots can be aligned in a direction parallel to the door axis and are positioned near one of the two opposite edges such that adjacent doors are aligned.

Pref. the pivots are adjacent the abutting edge of two doors. A silicone resin sealing strip is pref. provided on one side of the doors. The chamber is e.g. the oven of an automatic wafer baking machine. 29.4.76 as 017513 (4pp)

BENI- D11 57528Y/33 =GB 1542-218
Forming dough into balls and kneading them - in a trough of which the sides move longitudinally and transversly
BENIER BV 19.02.76-NL-001680
*(14.03.79) *BE-851-215 +A21c-11*

Dough moulding machine comprises a kneading trough with an horizontal bottom and sidewall plates which diverge upwardly. A rotary device moves the plates in opposite directions longitudinally at rates which can be adjusted individually, the angle between the plates and the trough bottom is also adjustable to suit the particular application. The rotary drive members impart longitudinal movement to the sidewalls relative to the trough and simultaneously produce a transverse movement. A dough piece placed between the plates is thus rounded while being conveyed to the discharge end of the machine.

Superior results in comparison with conventional equipment are achieved in a machine which is easier to adjust and clean. 11.2.77 as 005671 (4pp1364)

Machine to inject brine, etc. into meat - at automatically controlled delivery rate ensuring uniform distribution in meat
TOWNSEND ENG CO 06.11.78-BE-871798
(01.03.79) A22c A23b

Liq. is pumped through a receiver to a set of hollow needles which are reciprocated to be first inserted into and then withdrawn from the heat. The needle speed is varied w.r.t. the meat. During part of the time for which needles are inserted in the meat, fluid is injected by the pump via receiver and needles. The rate of discharge of fluid through the needles is directly proportional to the speed of displacement of needles w.r.t. the meat. For any speed of displacement the rate of delivery of fluid via the needles is adjustable.

Fluid injection should not start until the insertion of needles has started and injection should cease before needles are withdrawn. The speed of needle displacement is pref. max. at mid-displacement on the entry and withdrawal strokes.

Used for injecting brine, etc. into meat, ham, bacor uniform and controlled. distribution of brine, etc. into heat. The rate of fluid injection is made directly prop tional to the speed of needle displacement. 6.11.78 as 871798 (21pp448)

(27.02.79) A23l-01/16

Dough is made from wholemeal flour with no free starch and 85% passing a USS 16 mesh screen. The dough is heated and cooked in an extruder which creates pellets extruded below the gelatinisation temperature of the dough. The pellets are dried to 12% moisture and are tempered to establish a uniform moisture distribution.

After flaking the pellets are heated in a gas at 250-350 °F to cause discrete, uniform blistering on both surfaces in a period of less $<$1 min. Finally the blistered flakes are heated to 300-370°F to a stable moisture content.

Breakfast cereal is produced for consumption with milk.

On the addition of milk the flakes rehydrate as a result of the fracture of the flake structure rather than conversion to a mush. This is promoted by a minimum of fine flour particles or oversized grit in the dough . 23.5.75 as 227702 (16pp295)

Oxygen-absorbing compsn. for food preservation contain (A) a metal powder (Zn, Cu and esp. Fe or their mixts) coated with 0.001-10 pts.wt. (pref. 0.01-5 pts.wt.) of a metal(Li, Na, K, Mg, Ca or Ba) halide (Cl pref. or Br or the total water content of the metal plus metal halide being < 1 wt.% (pref. < 0.5 wt.%, esp. < 0.2 wt.%); and (a water-contg. material, pref. a particulate (0.5-10 min material contg. > 1 wt.% of water; the particles are impregnated with an aq. moisture-regulating soln. Components (B) is used in an amt. > 0.1 wt.% w.r.t (A). Pref. the compsn. contains a binder e.g. CMC or PVA.

Components (A) and (B) are kept separately from the food, but in the same gas-impermeable bag or container. Component (A) starts absorbing oxygen only upon contact with component (B). The components must be contacted immediately before enclosure in the food-contg. bag or container, but (A) and (B) must be kept separately from the food in a gas-permeable bag or container. The oxyge absorption capacity of the compsn. is not affected by the quantity of the water vapour emitted by the food. 23.8.78 as 836876 (28pp70)

BLUE- ★ D13 20301B/11 ★DT 2837-82
Protein-contg. feed additive for ruminants - produced by dryin protein-contg. solns. at pH 9-13.5
BLUE WING CORP 26.08.77-US-828152
C03 (08.03.79) A23k-01

In the prodn. of a feedstuff, a protein-contg. material is dissolved in an aq. medium, and the soln. is adjusted to pH 9-13.5 and dried to give a particulate compsn.

The prod. is a feed supplement for ruminants. The pr -tein content passes through the first stomach of ruminants without being digested, but is digested in the fourth stomach and lower intestinal tract. This avoids the loss in nutritive value which normally occurs in ruminants due to decomposition of dietary protein by the microflora of the first stomach. 25.8.78 as 837822 Add to 2710554 (46pp280)

BPNU- ★ D13 20321B/11 ★FR 2393-5
Liq. fish protein food prod. for pigs - prepd. using liquefied protei fish and accelerator additive (SW 8.1.79)
BP NUTRITION UK 09.06.77-GB-024071
C03 (09.02.79) A23j-01/04 A23k-01/10 A23k-03

The "silo fish" (i.e. fish liquefied by means of enzyme action naturally present and an accelerator additive) is prepd. by mixing the fish with previously liquefied prote and with an additive which initiates and accelerates the liquefaction process.

The prod. is used for pig food. The process avoids th need for finely cutting up the fish, the transport of the chopped up fish, the mixing of a solid mass and the need for high power mixing equipment. 8.6.78 as 017192 (9pp597)

PALM- ★ D13 20323B/11 ★FR 2393-5
Treating manioc or cassava to produce a semolina or flour - continuously using machines for the different stages of cleanin cutting, grinding, etc.
SOC PALMIER HUILE (BERT-) 07.06.77-FR-017318
(09.02.79) A23n-01/02 A23n-13

The manioc is treated by removing the earth and stones from the tubers, washing, topping, and then cutting the tubers into longitudinal pieces, cleaning them and cuttin them up into small substantially cubic pieces. The piec are then crushed and ground, followed by draining to recover the particles, which are then treated to remove lu followed by drying. The dried product is then ground an sieved. The process is continuous or semi-continuous.

The prod. used in food prepns. is prepd. as a semoli or a fine flour. The process enables semi-automation o the process, which is at present mostly manual, using machines at particular stages adapted for that purpose. 7.6.77 as 017318 (11pp597)

Oral deodorising compsn. - contg. extract of Yucca gloriosa, vegetable protein, sweetener, colourant, lubricant, vehicle and binder
MICHEL G H 22.04.77-US-790041
E12 (D21) (21.11.78) A23g-03 A23l-01/34 A61k-07/26

Compsn. comprises a mixt. which consists of 1.0-90.0 wt. % of solid material contg. 50% of an extract produced from species of Yucca gloriosa, having about 3 wt. % moisture content and 10.0-90.0 wt. % of vegetable edible protein and the balance wt. % of a sweetening agent, a vegetable, edible dye, a lubricating agent, an excipient vehicle and a binder. Pref. the sweetening agent is cane sugar or sodium saccharin, the vegetable, edible dye is water-soluble chlorophyll, the vegetable edible protein is soyabean protein or Indian corn protein, the excipient vehicle is ''Atmos 150'', the binder is ''Avicel'' and the lubricating agent is Mg stearate or Zn stearate.

Compsn. can remove tobacco odour or alcoholic liquor odour from the mouth. 13.9.77 as 109543 (3pp15)

KANE ★ D13 20508B/11 ★J5 4014-527
Water-in-oil cream or emulsion composition - contains sorbitol, di:glyceryl-mono or di-oleate, liq. oil and water
KANEBO KK 29.06.77-JA-078317
E17 (02.02.79) A61k-07

The compsn. contains (I) sorbitol, (II) diglyceryl-monooleate and/or diglyceryl-dioleate, (III) liq. oil and (IV) water.

The compsn. has excellent preservability, mechanical stability, appearance, homogeneity and affinity to skin, and gives a refreshing feeling application.

Pref. amt. of (I) is 6-16 w/w% and (II) is 2-6 w/w% (III) is ester oil and/or vegetable oil in an amt. of 10-40 w/w% and amt. of water is 50-70 w/w%. The compsn. may also contain wax, such as ceresin wax, microcrystalline wax, whale wax, vaseline or beeswax, and UV-absorbent, antiseptic, antioxidant and perfume. 29.6.77 as 078317(6pp5)

SUNN- ★ D13 20511B/11 ★J5 4014-539
Artificial rice prodn. for use as koji - by heating starch and/or grain under pressure to cause alpha-lysis and granulating
SUNNY MAIZE KK 04.07.77-JA-079104
(02.02.79) C12g-03/02

Artificial rice is prepd. by heating starch, grain powder or their mixt. under pressure so that α-lysation degree of starch becomes > 70% and granulating it through extruding it without swelling.

As starting material, powdery starch material such as corn starch, waxy corn starch, wheat starch, rice powder etc. can be applied singly or together. The α-lysation and granulation are practiced using the α-lysing equipment such as expansion pellet mill, puff machine, extruder, etc.

The artificial rice not only is less expensive c.f. the 'koji' materials applied conventionally, but also it can be processed to 'koji' by the simple process. The artificial rice is more easily saccharified with amylase than conventional 'koji' material such as crushed rice and obtd. 'koji' shows similar amylase activity and much higher protease activity c.f. the 'koji' prepd. from conventional 'koji' material. 4.7.77 as 079104 (4pp5)

Natural food colourant prepn. - by immersing black soybean in water or aq. ethanol soln., concentrating the extract, opt. treating with acid and removing the insolubles
MITSUBISHI PETROCH KK 06.07.77-JA-079817
(02.02.79) A23l-01/27 A23l-02/38

Process comprises (a) immersing black soy bean (Glycine max (L) merril) in water or aq. ethanol soln.; (b) concentrating the extract; (c) opt. treating the conc. extract with acid; and (d) removing the insolubles from the extract.

Red or red-purple natural colourant is prepd. inexpensively, for colouring soft drinks, jelly, etc. The colourants do not cause turbidity and/or floc formation. 6. 7. 77 as 079817 (3pp5)

AKIY- ★ D13 20518B/11 ★J5 4014-564
Food with antihypertensive, antidiabetic activities etc. - contains onion extract prepd. by concentrating the pressed juice of the discoid stem of the onion
AKIYAMA JOZAI KK 01.07.77-JA-078710
B04 (02.02.79) A23l-01/34 A61k-35/78

Food contains the onion extract obtained by concentrating the pressed juice of the discoid stem of onion at 60-90°C. The onion extract is obtained by peeling the epidermis of the discoid stem of onions, washing the peeled discoid stem mashing it and pressing the juice. The extract is concentrated at 60-90 (70-80)°C under reduced pressure and the pasty residue is sterilised.

The onion extract shows not only nutritive and healthy effect, but also curing effect on high blood pressure, anteriosclerosis, thrombosis, diabetes, etc. 1. 7 77 as 078710 (3pp5)

MITU ★ D13 20520B/11 ★J5 4014-583
Culturing yeast having low odd-carbon fatty acid content - using yeast strain in which enzymic system for synthesising fat directly from fatty acid is deficient or almost inactivated
MITSUBISHI CHEM IND KK 06.07.77-JA-080785
(D16) (02.02.79) A23k-01 A23l-01/34 C12c-11/08 C12d-01/0
C12d-13/08 C12k-01/02

Process comprises culturing a yeast strain in which enzymic system for synthetising fat directly from fatty acid not through acetyl coenzyme A, is defficient or almost inactivated.

The yeast body having low odd-C fatty acid content can be obtd. by culturing the yeast strain even in the culture medium containing n-paraffin, higher alcohol or higher fatty acid having odd-C number as carbon source. 6. 7. 77 as 080785 (10pp5)

HONS ★ D13 20522B/11 ★J5 4014-585
Highly acid milk culture with high living bacteria content - contain
Bifido-bacterium and slow acid-forming lactic acid bacteria
YAKULT HONSHA KK 01.07.77-JA-077839
(D16) (02.02.79) A23c-09/12 A23l-01/34 C12k-03

The milk culture contains a Bifidobacterium bacteria (e. g Bifidobacterium bifidum, B. longum B. breve, etc.) and a slow acid-forming lactic acid bacteria (. e. g. Lactobacillu acidophilus, L. fermenti, etc.). It is prepd. by inoculating the Bifidobacterium bacteria and the slow acid-formin lactic acid bacteria in a culture consisting mainly of milk and aerobically cultivating it.

The milk culture can be obtd. in a short cultivation period without displacing the gaseous phase of the culture vessel with nitrogen or adding growth promoting substanc such as yeast extract and corn steep liquor. Even when those strains poor in oxygen-resistance are employed, th living bacteria in the culture, partic. Bifidobacterium bacteria, do not easily die out, and therefore the culture can easily be processed or preserved. Pref., 1-3 wt. % o a mixed starter comprising the Bifidobacterium strain an the slow acid-forming lactic acid bacterium, in a ratio of 0.5:1-3:1, is inoculated into the culture. 1. 7. 77 as 07783 (4pp140)

Low calorie chewing gum prodn. - by adding xylitol, mannitol, water, etc. to chewing gum base, kneading, rolling into sheets and cutting

LOTTE KK 24.06.77-JA-074508

E17 (08.02.79) A23g-03/30 A23l-01/23

Method comprises adding (a) xylitol, (b) mannitol, in amt. 10-30 w/w% of the xylitol, (c) water and (d) additives for chewing gum such as glycerin, perfume, etc. to (e) chewing gum base, kneading the mixt., rolling the mixt. and cutting the rolled sheet.

The use of xylitol and mannitol together gives a delicious sweetness with suppressing the astringency of xylitol. Hygroscopic resistance is greatly improved. 24. 6. 77 as 074508 (3pp5)

LOTT ★ D13 21006B/11 ★J5 4017-165

Porous chewing gum prepn. - by adding sugar, millet jelly, perfume etc. to gum, kneading, rolling, cutting and freeze-drying

LOTTE KK 01.07.77-JA-077815

(08.02.79) A23g-03/30

Process comprises (a) combining additives such as powdery sugar, millet jelly, perfume, etc. with conventionally prepd. chewing gum base; (b) kneading the mixt.; (c) rolling; (d) cutting the rolled sheet to obtain chewing gum of moisture content 3-15%; and (e) freeze-drying under a vacuum $<$1 mm Hg.

The specific gravity of the chewing gum can be decreased sufficiently without deteriorating texture, taste or flavour. Prod. has specific gravity $\sim$ 50% of that of conventional gum. 1. 7. 77 as 077815 (3pp5)

AJIN ★ D13 21007B/11 ★J5 4017-167

Yeast extract prepn. - by adding autolysis accelerator to yeast body suspension, autolysing, heating and reacting with nuclease

AJINOMOTO KK 07.07.77-JA-081156

(D16) (08.02.79) A23l-01/28

Process comprises (a) adding the accelerator for autolysis to a suspension of the yeast body; (b) autolysing; (c) heating (d) reacting with the nuclease obtd. by inactivating harmful enzymes in malt root; and opt. (e) adding lactic acid to the reaction mixt.

Prod. has good taste and texture and is free of malt odour, is prepd. using inexpensive malt extract and can be used as seasoning or the base for complex seasoning. 7.7.77 as 081156 (4pp5)

TANA ★ D13 21016B/11 ★J5 4017-192

Brewing syoyu using defatted soybean and wheat - by preparing syoyu koji, steeping in high concn. saline soln., and mixing with enzymatically decomposed steamed defatted soybean

TANABE PHARMACEUTICAL KK (UEDA-) 08.07.77-JA-082313

(D16) (08.02.79) A23l-01/23

Prepn. comprises (a) preparing 'syoyu koju' using 1/5-2/3 amt. on whole material with the ratio defatted soybean to wheat of 1:0.2-4; (b) steeping the 'syoyu koju' obtd. in cold saline soln. of high concn.; (c) separately mixing steamed defatted soybean opt. in admixture with crushed roast wheat, with the saline soln. in which the enzymes including protease and amylase are previously suspended; (d) laying the mixt. obtd. in (c) on the steeped mixt. obtd. in (b); (e) standing the whole compsn. at 20-55°C for > 5 hrs. to effect enzymic reactions of the mixt. obtd. in (a) and (f) mixing the steeped mixt. and the enzymically decomposed prod. for obtaining 'syoyu moromi'.

The amt. of 'koji' can be decreased and the loss of the materials due to the heat at preparing 'koji' is decreased. Thus the yield of 'syoyu' and the availability of materials can be increased. The proportion of defatted soybean and crushed roasted wheat can be varied widely and various 'syoyu' different in taste and flavour can be prepared. 8.7.77 as 082313 (5pp5)

NAGA- ★ D13 21017B/11 ★J5 4017-193

Barley tea prepn. - by roasting barley, crushing, adding roasted barley seed, glucose and caramel, and heating

NAGAKURA SEIBAKU KK (MEIJ) 18.03.77-JA-029228

(08.02.79) A23f-03

Process comprises (a) roasting barley; (b) crushing it roughly; (c) adding roasted embryo (I) of barley, glucose and caramel; (d) heating the mixt. to 90°C; and opt. (e) packaging the mixt. with water permeable thin film.

Barley tea drink with excellent flavour is obtd. from the instant tea by immersing it in water or warm water without boiling.

Specifically, (I) is roasted at 100-115°C for 30-35 mins and roasted (I) is added 0.5-7 w/w% on barley. Glucose is applied 5-40 times in weight on (I) embryo. Caramel is added 1/2-2 times in weight on roasted (I). 18.3.77 as 029228 (3pp5)

STRK ★ D13 21198B/11 ★NL 7709-303

Heat treatment process for liquid products - with means of recovering heat from finishing product and of varying direct-indirect steam in section temperature

STORK APP BV 23.08.77-NL-009303

P13 (27.02.79) A01j-11/16 A23l-03/22

A process is described whereby a fluid product such as milk undergoes heat treatment. The product is preheated in a regenerative heat exchanger, brought to a predetermined temp. in a hot water heater (indirect steam heater) and then passed through a steam injection point at which it is brought to the sterilisation temp. The temp. of the product is then maintained in a dwell loop before it is shock cooled in a flash vessel. The vapour from the flash vessel is drawn off via a water cooler by a vacuum/condensate pump and the product passes through the regenerative heat exchanger where a portion of its heat is recovered by the incoming cold product.

The system allows flexibility in the choice of the temp. at which the direct steam injection commences and permits more than 50% of the energy used to be recovered in the regenerative heat exchanger. By varying the flash vapour draw-off, the product may be concentrated or diluted. 23.8.77 as 009303 (9pp1370)

Automatic analysis of fruit and juice - measuring soluble solids content and pH
RELIANCE ELECTRIC CO 08.12.76-US-748850
J04 R16 R27 (22.08.78) G01n-33/02 G06f-15/46

Liq. is anlaysed to determine its soluble solids content by feeding the liq. into a vessel with a plummet suspended from a weight transducer. The change in weight detected by the transducer on introducing the liq. is used together with a temp. reading to determine the soluble solids content. The pH of the sample is then determined by feeding the sample into a titration vessel where it is weighed. Alkali is added until a predetermined pH is measured by a probe at which time the vessel is reweighed to calculate the weight of alkali added, allowing the pH of the sample to be calculated.

Appts. includes a weighing scale for recording the weight of a whole fruit placed on it and a computer stores this reading together with the pH and solids measurements of the liq. sample. Appts. analyses the juice of a fruit and together with the weight measurements of the fruit allows a statement to be produced concerning the soluble solids and pH of a batch of fruit. 8.12.76 as 748850 (16pp)

DAIK ★ D13 21806B/11 ★US 4142-372
Controlled atmosphere storage of fruit and vegetables - including continuously feeding low oxygen content air via adsorber into refrigerator
DAIKIN KOGYO CO 22.10.76-JA-127698
Q74 (06.03.79) B01d-53/02 F24f-03/16

The method comprises feeding air and refrigerator atmosphere to an adsorbent, e.g. zeolite, which adsorbs more N_2 than O_2. The high O_2 content air of the adsorber is expelled followed by part of the remaining high O_2 content air. The N_2 is desorbed with the remaining air to obtain the desired O_2 content air which is fed to the refrigerator.

The recycling of the refrigerator atmosphere is carried out in order that the time for expelling the high O_2 content air of the adsorber is gradually shortened while the time for feeding the desired O_2 content air into the refrigerator is gradually lengthened.

The amt. of desired O_2 content air obtd. from a definite amt. of atmospheric air and the refrigerator atmos. is gradually increased to rapidly lower the O_2 content of the refrigerator to the desired O_2 content. 19.10.77 as 843736 (16pp1044)

Press with two eccentrically mounted perforated drums - telescopically received to create pressing nip
SIMON-ROSEDOWNS LTD 29.01.77-GB-003718
P71 (14.03.79) B30b-09/20

A press comprises an outer perforated drum mounted freely on a horizontal axis, An inner perforated drum of smaller dia. is mounted eccentrically within the outer drum and is driven about a horizontal axis lying vertically beneath the axis of the outer drum.

Material is introduced into the chamber formed between the inner and outer drums and is carried through the nip at the bottom of the drums where they approach each other with a min. distance. Pref. a baffle is mounted at the twelve o'clock position and separates the material inlet and outlet augers.

The appts. presses liquid from comminuted vegetables. 5.1.78 (3pp295)

NATR ★ D14 20396B/11 ★GB 1542-257
Cylindrical press with perforated walls and pressing piston - with second piston discharging compressed residue
NATIONAL RES DEV CORP 03.09.75-GB-036300
P71 (14.03.79) B30b-09/02

A press comprises a perforated cylinder closed at one end by a wall with an axial aperture. This aperture accepts the rod of a free piston which fits against the interior of the end wall. Material is loaded into the open end of the cylinder and is compressed by a pressing piston which is advanced towards the free piston against which the material is compressed. Juice is discharged through the perforated cylinder wall.

After compression the pressing piston is retracted and the cylinder is moved axially away from it until the piston rod of the free piston engages a stop. Further movement of the cylinder causes the free piston to sweep the cylinder of residue which is discharged through the open end of the cylinder.

The appts. expresses a protein rich juice from vegetable fibre e.g. grass. The use of the free piston avoids the need to have a removable end wall at the closed end of the cylinder to discharge residue. 2.12.76 (3pp295)

Fruit and vegetable sorting conveyor - has spaced rollers through which undersized fruit fall, and extra rollers which lift fruit from between main rollers
ORCHARD VINE EQUIP 14.10.74-SU-067049
P43 (08.04.77) A23n-15 B07b-13/04

Sorting conveyor comprise endless chains with working rollers linked to them, and an ejector. Pinching of the fruit as they leave the conveyor is avoided by making the ejector as a 3-link rotating bracket with rollers, freely sitting on its axes. The dia. of the rollers of the ejector is less than the dia. of the working rollers. The distance from the ejector roller axes to the rotating bracket axes is at least equal to the distance from them to the axes of the working rollers.

A rotary cutter for peeling pineapples includes a movable mounting head and a circular disc supported centrally on a shaft which is mounted on the mounting head. The disc has a series of peripheral teeth which cuts on ovoid path through the outer layer of the pineapple.

A pair of gauge shoes is connected to the mounting head, one gauge shoe being disposed on each side of the cutter periphery for limiting the depth of penetration of the cutter teeth into the fruit surface as the pineapple is indexed into a cutter station to move the mounting head and the cutter in accordance with the size and shape of the incoming fruit so that the cutter peels the fruit at a desired depth and attitude. 11.4.77 as 786615 (33pp1363).

PETI/ ★ D14 21550B/11 ★US 4108-138
Oven with base supporting food and fuel - covered by dome made of sectors of fire-resistant material
PETIN C 01.07.76-US-701564
(22.08.78) A21b-01/28

The oven comprises a flat base which acts as both the cooking surface and a support for burning solid fuel. The top of the oven is formed of a dome made of separate fire-resistant sectors. The dome has a single opening around which walls are built to crrate an entrance.

A flue extends upwardly from these walls in front of the opening so that combustion prods. from the burning fuel travel horizontally within the dome and then escape through the flue. Doors cover the entrance and act as dampers to control the quantity of combustion prods. which escape.

The oven is used to cook food on the same surface that carries burning logs. 1.7.76 as 701564 (6pp295).

WEIL- ★ D14 21586B/11 ★US 4108-387
Food grinder with external adjuster - for changing bias of rotating knife against upstream face of extrusion plate
WEILER & CO 25.03.77-US-781240
P41 (22.08.78) B02c-18/36

The grinder comprises an auger with a perforated plate at its downstream end. A rotating knife is biased against the upstream face of the plate. The bias of the knife against the plate may be adjusted without disassembling any part of the grinder.

The adjuster comprises an inner screw threaded pin and an outer screw threaded pin concentrically threaded onto the inner pin. The upstream end of the inner pinis biased by a compression spring and its downstream end as accessible from outside of the grinder. The outer pin is non-rotatable w.r.t. the auger and the knife and has a downstream facing shoulder bearing against the knife. Rotation of the inner pin advances it against the compression spring to increase the bias of the shoulder against the knife. The spring and upstream ends of both pins lie within a cavity in the downstream end of the auger.

The appts. provides an adjustment for the bias of a knife against the extrusion plate of a food grinder. The adjustment can be made without disassembly of the grinder. 25.3.77 as 781240 (4pp295).

Appts. for sepg. a mixt. of oil and water has a mixt. inlet and separate water and oil outlets. An oblong separator element, permeable to fluid, for the mixt. is mounted in a pressure housing. The element is of non-woven polyester felt, being fully saturable by water and impermeable to oil up to a predetermined pressure difference. The entire mixt. to be sepd. flows through the element inlet. 4.12.74. as 457289 (7pp160)

RHEH ★ D15 20153B/11 ★DT 2738-528
Removal of oil from contaminated surfaces - by adsorption on solids, pref. mineral fibres (PT 15.2.79)
VKI-RHEINHOLD & MAH 26.08.77-DT-738528
H03 J01 +Q42 (08.03.79) C02b-00/ C09k-03/32 E02b-15/04*

Oil or oily substances are eliminated from surfaces, e.g. ground or water, by adsorption on a solid material, pref. mineral fibres. The mineral fibres are used in the form of mats, slabs or flock and have bulk density 30-120 (30-50)kg/m^3. They pref. consists of rock fibres and/or wool, which are cheaper than asbestos.

Used for cleaning of oil spills, etc. on land or sea. The process is simple, requires no special equipment and can be used on solid surfaces or water. The oil can subsequently be squeezed out of the absorbent and the latter re-used. Mineral fibres are very light, easily compressed for transport and non-combustible. 26.8.77 as 738528 (9pp195)

DERO- ★ D15 20194B/11 ★DT 2739-335
High purity sterile water production - in reverse osmosis cells with overflow and surplus permeate recycled to desalination section
DEUT ROTEN KREUZ 01.09.77-DT-739335
(08.03.79) C02b-01/82

High-purity water, free from germs or particles, for medicinal injection preparations and technical purposes is made from fully desalinated water by reverse osmosis. The overflow part of the reverse osmosis is circulated and cooled, if necessary. If the permeate is not discharged, it is also circulated.

This prevents bacterial damage to the membranes in case of stoppages when there is no demand for high-purity water, and saves the necessity for reservoirs for the permeate. 1.9.77 as 739335 (20pp39)

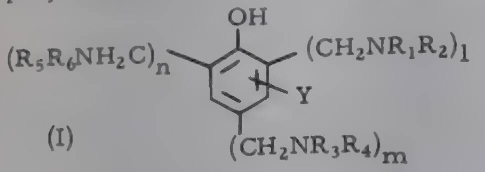
PALM/ ★ D15 20214B/11 ★DT 2739-690
Communal and industrial wastes treatment - in series of filter columns with aerated packed risers
PALMER W F 02.09.77-DT-739690
A88 (08.03.79) C02c-01

A system for the purification of communal and/or industrial wastes includes a first filter column which receives the effluent on top from a riser. The wiser is filled with a packing for neutralisation, biological cleaning filtration and/or absorption and is aerated at the bottom elbow. The filter and the subsequent filters, joined by similar risers, contain strainers, filtering and biological cleaning materials.

This combines mechanical, chemical and biological systems in one continuously operating plant. The pass-through time and the time required to digest all contaminations are not longer than required by a simple mechanical filter although it can deal even with intensively laden effluents. The filters can contain a packing of plastic rings or porous plastic foam, e.g. of polyurethane, polyolefin or polystyrene. 2.9.77 as 739690 (40pp39)

MITU ★ D15 20258B/11 ★DT 2835-876
Cationic flocculant esp. for treating effluents - consists of water-soluble polycondensate of epihalohydrin and phenol, formaldehyde and amine reaction prod.
MITSUBISHI CHEM IND KK (KYOY) 24.08.77-JA-101208
A91 (A21) (08.03.79) C08g-59/10 C09k-03

Cationic polymeric flocculant consists of a water-sol. polycondensn. prod. of an epihalohydrin and an amine (a) of formula (I) (where Y is H or lower alkyl; R_{1-6} are opt. identical lower alkyl and l, m and n=0 or 1, provided l, m and n do not all denote 0) or a mixt. of (a) with ≥1 cpd. (b), e.g. NH_3, monoalkylamines, dialkylamines, alkylene diamines, aromatic amines, polyalkylene-polyamides and cyclic amines, provided amt. of (a) is 50 mol. % of (a)+(b).



(I)

The flocculants are used for treating industrial effluents, e.g. from paper, dye or food industry, for purifying river water, accelerating the settling of sludge, treating oil-contg. streams, accelerating clay filtration in cement mfr., for concn. and filtration of clay sludges in porcelain or ceramic industry, for dehydrating concentrates and for clearing streams contg. (anionic) surfactants. The flocculants may be combined with other inorganic and/or organic flocculants, e.g polyacrylamide. 16.8.78 as 835876 (29pp200)

COAF ★ D15 20287B/11 ★DT 2837-491
Treatment for effluent with emulsified hydrocarbon(s) - in combined filtering and coalescence tank
CREUSOT-LOIRE 07.09.77-FR-027147
H03 J01 Q24 Q42 (08.03.79) B01d B63j-05 C02c-01/38 C02c-05 E03f-05/16

Compact device for the continuous processing of waste fluids containing emulsified hydrocarbons, e.g. wastes from flushing the bunkers of ships, includes inside a vertical tank a central chamber, open at the top, containing the oleophilic coalescent agent. The chamber rests on and is surrounded by a granular filtering material. The hydrocarbons are decanted from the top of the tank by a float valve.

Appts. combines the normal two stages (gravity sepn. and coalescence filter) into one integrated process. The result is very compact plant for continuous operation. 28.8.78 as 837491 (17pp39)

GESL ★ D15 20342B/11 ★FR 2393-765
Treating waste water using aluminium oxide - doped or surface treated with cations or anions SW 8.1.79)
KERNFORSCH KARLSRUH 05.05.78-DT-819573 (10.06.77-DT-726192)
E33 (09.02.79) C02c-05/02

The process comprises using either (a) an Al oxide doped during its prepn. with cations or anions which can be incorporated into the crystalline network and which retard crystallisation of the Y phase of the Al_2O_3 or (b) an Al_2O_3 the surface of which is treated after its prepn. with ≥1 salt of these ions.

The process may be applied to the elimination of difficulty biodegradable organic substances. It overcomes a previous difficulty that Al_2O_3 had a very weak absorption power for neutral and basic substances. It enables wide application of the process and results in a large interior surface (e.g. 230 m^2/gm cf 80 m^2/gm) with stabilisation resulting in better absorption properties. It is cheaper than active carbon. 9.6.78 as 017362 (+ 5.5.78 - DT - 819572)(14pp597)

A combined waste treatment plant comprises a biological dry toilet and a biological waste water purifying plant. The tiolet includes a composting tank and a filter for sepg. sludge from waste water. The purifying plant includes a sedimentation tank and a biological filter. A suction fan is provided for changing the air in the composting tank and the biofilter. A common pump is used for alternately removing sludge and circulating the water to be purified.

Used in sewerless houses, for treating tioilet and kitchen waste. The heat contained in the grey water is recovered by a heat exchanger and used to heat the composting waste. Purified water from the biofilter may be discharged into the soil. The compost may be used on residential lots as fertiliser. 31.8.78 as 035199 (5pp1044)

Biologically treating poly:thionic acid-contg. waste water - using activated sludge in presence of gradually reducing amts. of thio:cyanogen and thiosulphuric acid
MITSUBISHI HEAVY IND KK 06.07.77-JA-079937
E36 J01 (05.02.79) C02c-01/02

Method of biologically treating polythionic acid-contg. waste water, e.g. wet desulphurisation waste water, comprises pouring the waste water and thiocyanogen and thiosulphuric acid which are nutrient sources for activated sludge, into activated sludge produced using the nutrient sources aerobically to biologically oxidise the polythionic acid to sulphuric acid, and then, after treatment of the polythionic acid has been confirmed, the inflow of thiocyanogen and thiosulphuric acid is gradually reduced.

The activated sludge used includes thiocyanogen decomposition sludge, thiosulphuric acid decomposition sludge, phenol decomposition sludge, etc.

The complete conversion of the polythionic acid into sulphuric acid obviated the need for post-treatment as in the case of ion exchange resin treatment. This method is also applicable to the wet type stack gas desulphursation-denitrification waste water. 6. 7. 77 as 079937 (4pp117)

Appts. for purificn. of cyanide contg. waste water - comprises an oxygen or air bubbler, a quartz tube sheathed UV ray irradiator and cooling equipment
NIPPON SANGYO GIJUT 07.07.77-JA-080448
(05.02.79) C02c-05/04

The appts. comprises oxygen or air bubbler provided at the lower part of the tank, a quartz tube-sheathed UV rays irradiator provided up the central part of the tank, and a cooling equipment inside the tank. Cynide-contg. waste water is oxidised at pH 11 to 12 by an oxidising agent or finely bubbled air or oxygen under UV ray irradiation while removing insuluble substances formed during oxidation. Part of the effluent discharged after the completion of oxidn. is recycled into the waste water feed pipe.

This method is capable of decomposing cyanides present in waste water with a simplified appts. in a very short time, and thus is applicable to the treatment of plating waste water, etc.

Specifically the oxidising agent includes H_2O_2, hypochlorite, etc., and the UV rays used is pref. of $>$ 300 mm wavelengths. 7. 7. 77 as 080448 (7pp117)

KANA/ ★ D15 20679B/11 ★J5 4015-355
Removal of ammonium ions from waste water - using mixt. of sand, diatomaceous earth and sewage sludge as adsorbent
KANAI M 06.07.77-JA-081173
E35 (05.02.79) C02c-01/40 C02c-05/02

Waste water is mixed with sand in addition to the sewage excess sludge, together with diatomaneous earth, and then the mixt. is allowed to stand to obtain supernatant liquid or filtered.

The method is capable of removing 40-50% NH_4 content and the used sewage excess sludge can be repeatedly employed. In an example 1 l of water contg. 201 ppm NH_4 was mixed with 3 l of excess sludge with stirring and then filtered, to give 95-130 ppm NH_4-contg. water. The removal rate of NH_4 was approx. 50%. 6. 7. 77 as 081173 (1pp117)

KUBI ★ D15 20680B/11 ★J5 4015-35
Waste water treatment by coagulation - in which water from conventional treatment is treated with coagulant, the particle sepd. and supernatant treated with further coagulant
KUBOTA KK 05.07.77-JA-081855
(05.02.79) B01d-21/ C02c-05/02*

In the treatment of sewage, human waste and industrial effluents, the water from the conventional coagulating se imentation treatment is treated with a coagulant, e.g. aluminium sulphate, slaked lime, etc. with stirring, the treated water is allowed to stand in a first sedimentation basin where comparatively coarser particles composed of $>$ 10000 mol. wt. components are pptd. and then discha -ged, and then the supernatant from the first sedimentati basin is again treated with a coagulant in a second sedime -ation basin where comparatively finer particles compose of $<$ 10000 mol. wt. components are pptd. and then remo -ed.

Method removes COD components and coloured materi at a removal rate $>$ 90% without the aid of ozone, activat carbon, etc. after coagulating sedimentation treatment. Method also simplifies treatment, so reduces cost, maint enance, etc. 5. 7. 77 as 081855 (3pp117)

Hydrogen chloride and metal oxide(s) recovery - from, e.g. pickling effluent, by an efficient process utilising waste heat in the process and less water

CHIYODA CHEM ENG CO 06.07.77-JA-080004

E36 M12 (E37) (05.02.79) C01b-07/08 C01g-49/02

HCl and metal oxides are recovered from waste HCl soln. contg. Fe chloride, $MgCl_2$ and $AlCl_3$ etc., e.g. pickling effluent etc., by (a) contacting the waste HCl soln. with waste gas from a subsequent HCl-absorbing step (c) to carry-out heat exchange; (b) passing the heated waste HCl soln. to a roasting step where it is sepd. by roasting into HCl gas and metal oxides which are recovered; and (c) contacting the HCl gas with effluent recovered in washing the waste gas resulting in the heat exchange with water to recover HCl, the waste gas being returned to (a).

No discharge of waste liquor contg. HCl and metal oxides from the final waste gas-washing tower occurs. 6.7.77 as 080004 (3pp34)

TOYJ ★ D15 20723B/11 ★J5 4015-497

Concentrating dil. aq. aluminium sulphate - by adding sodium (bi)carbonate , calcium carbonate or calcium hydroxide, and adding sulphuric acid to the ppte.

TOYO SODA KK 00.00.78-JA-079743 (05.08.75-JA-094756)

E33 (05.02.79) C01f-07/74

The dil.aq. aluminum sulphate soln., resulting e.g. from the treatment of an $Al(OH)_3$-bearing sludge (in the treatment of industrial waste waters, sewage, etc. with an Al-bearing coagulant) with H_2SO_4 to dissolve $Al(OH)_3$ and to improve the treatability of the remaining portion of the sludge. The soln. is concd. by adding Na_2CO_3, $NaHCO_3$, $CaCO_3$ or $Ca(OH)_2$ such that the pH is 6 after neutralisation, to ppte crystals of Al cpd., separating the ppte from the soln., and adding H_2SO_4 to the ppte such that the final pH is 1.5-3.5, to dissolve it.

When using $CaCO_3$ or $Ca(OH)_2$ as neutralising agent, the pptn. of gypsum occurs simultaneously, but its sepn. is the fact that gypsum is hardly dissolved in H_2SO_4 and remains as a solid in the conc. aluminum sulphate soln. when the ppte is treated with H_2SO_4. 5.8.75 as 079743 Div.ex 94756/75 (3pp34)

NIKS ★ D15 20853B/11 ★J5 4016-368

Deodorisation appts. for treating e.g. human waste - comprises three deodorisation towers packed with ion exchange resins and a tower packed with active carbon

NIPPON KASEI KK 06.07.77-JA-081331

A91 J01 (06.02.79) B01d-53/34 B01j-01/06

Deodorisation appts. comprises appropriately arranged three deodorisation towers each of which is packed with an ion-exchange resin (a porous high polymer having a hydrophilic functional gp., e.g., -COOH, $-NH_2$, $-SO_3H$, -OH, etc.). The first tower is designed to absorb basic odorous substances with an acid soln. supplied from the upper side. The second tower is designed to absorb acid odorous substances with an alkaline soln. supplied from the upper side The third tower is designed to effect adsorption capability of the ion-exchange resin packed without use of chemical solns. The second and third towers are functionally exchanged with each other at specified times during operation. The air passed through the three deodorisation towers is then passed through an activated carbon-packed tower.

The appts. can treat high concns. of offensive odours, e.g. NH_3, H_2S, mercaptan, etc. emitting from human wastes treatment facilities, etc. with high efficiency continuous operation while keeping the ion-exchange resin going at capacity-plus. 6.7.77 as 081331 (5pp117)

HITG ★ D15 20854B/11 ★J5 4016-369

Treating waste sulphuric acid - by mixing with alkali contg. powder e.g. burned coal ash, coagulation and solidification

BABCOCK-HITACHI KK 07.07.77-JA-080466

(06.02.79) C02c-05/02

Waste sulphuric acid is mixed with an alkali-containing powder, e.g. burned coal ash, etc. to form a slurry etc. while effecting neutralisation. The slurry etc. is subsequently introduced into a certain mixing reactor to bring it to coagulation and then solidification. The neutralisation reaction is rapidly brought about, and thus the reaction products are formed in a fine crystal state. The reaction products form double salts with latent hydraulic components contained in the alkali-containing powder, which lend themselves to the formation of good solidified granules. This method, also, is much more economical than the conventional methods. 7.7.77 as 080466 (3pp117)

Removing iron and manganese from water e.g. for paper mills - by contacting with a filter medium e.g. coral fossil limestone then passing through calcium carbonate filter

KAJIYAMA KANKYO GIJ (TAKI-) 08.07.77-JA-082456
F09 (09.02.79) C02b-01/26

The water is contacted with a filter medium, e.g. coral fossil limestone, etc. to adsorb and oxidise Fe and Mn, and then is passed through a filter medium composed mainly of $CaCO_3$ with growing iron-bacteria to completely oxidise the Fe and Mn while aeration. The water passed through the filter medium is discharged to the outside.

This method easily removes iron and manganese dissolved in water in the form of ferric carbonate and calcium salt-contg. precipitate of a high filterability by simple operation and cheap maintenance. Large quantities of water can be treated using small scale apparatus. This method is effective for the treatment of water for construction work, water to be used for agricultural purpose, or water for use in paper mill. 8. 7. 77 as 082456(5pp117)

TEIJ ★ D15 21139B/11 ★J5 4018-152

Treating agent for waste water contg. emulsified oil - comprises a metal (hydr)oxide and a higher hydrocarbon gp.-contg. amine which is solid at ambient temp.

TEIJIN KK 12.07.77-JA-082492
J01 (09.02.79) B01d-15 C02c-05/02

A treating agent esp. for waste water contg. nonionic surfactant-emulsified oil, is a composite comprising an (in) organic support material, e.g. fibre, clay, etc. and a mixt. of a 6-60C-hydrocarbon group-contg. amine cpd. and/or its derivative (I) and metal oxide and/or metal hydroxide (II). Molar ratio of (I) : (II) is 0.01-0.5 : 1.

The agent is particularly suited to treat and separate emulsified mineral and animal oil, e.g., compressor drain, cutting oil-contg. waste water, rolled steel plate washing waste water, car washing waste water, etc., exhibiting the power to reduce the oil content to less than the effluent standard level simply by passing water to be treated through a column packed with the agent. 12. 7 77 as 082492 (7pp117)

Treating waste liquor contg. organic cpds. and ammonium sulphate - by wet oxidn. of organic cpds. and crystallisation of ammonium sulphate

NITTO CHEM IND KK 04.07.74-JA-075800
*A41 C04 E16 (E35) (15.02.79) *J51005-267 C02c-05/04*

Process for treatment of waste liquor contg. organic substances and ammonium sulphate (e.g. waste liquors from acrylonitrile mfg. process based upon ammoxidation of propylene, or from acrylamide mfg. process wherein acrylonitrile is hydrolysed in the presence of sulphuric acid) comprises (a) wet oxidation of the organic substances and (b) separation of ammonium sulphate by crystallisation. The waste liquor contg. organic substances and ammonium sulphate is treated with air or oxygen-contg. gas at high temp. and pressure under which the system is maintained in liq. state, to convert the organic substances to gaseous products by oxidation. The treated liquor is then evaporated to separate ammonium sulphate by crystallisation. After the the sepn. of ammonium sulphate, the mother liquor is recycled to the wet-oxidation process. In the wet-oxidation process conversion of the organic substances must be 75%.

Process allows a closed-system treatment of ammonium sulphate waste liquor, by which substantially 100% of NH_4SO_4 is recovered as a high-quality product. In contrast to dry burning process, this process does not cause generation of NO_X and/or SO_X. 4. 7. 74 as 075800 C02c-5/04 (15. 2. 79) NITTO CHEM IND KK (6pp) (J5 1005267)

In the desalination of water, two-stage evaporation processes are used, pressure and temp. in the second stag being lower than the first stage. Evaporation in one stage is conducted using condensation heat of vapour generated from the other stage. Starting salt water flows down in the inner surface of vertical evaporation vessel.

The vapour and the remaining salt water are collected at the outlet and introduced into the other vessel, and condensed vapour in each stage is collected. 19. 12. 75 as 150715 (clg. 20. 12. 74-IT-030811) B01d-1/28 (17. 2. 79) SOC ITALIANA RESINE SPA (8pp) (J5 1087170)

Spray device for distribution of liquid over a treatment bed - w horizontal spray pattern minimising overhead clearance required

MUNTERS C AB 31.08.77-SW-009810

J08 Q78 + P42 (02.03.79) B05b-01/26 C02c-01/04 F28f-25

Water is distributed over a horizontal treatment plane s as the upper surface of a bio-filler bed or a cooling towe by means of a spraying system. The system contains a series of horizontal distribution branches equipped with individual spray components. Each spray component con sists of inverted cones placed vertically over the outlet hole in the feeder branch such that the water issuing und pressure from the hole strikes the underside of the cone and is diverted horizontally in the form of a fine spray. the preferred form, the underside of the zone is equippe with stubs which break the flow of water to achieve a goo horizontal distribution pattern. The cone is pref. mounte on a vertical stem which passes through the hole in the -tribution branch and is anchored to the lower inside wal of the pipe.

The system enables the pipework to be laid in the filt bed or cooling tower structure and, since the spray is h -zontal, minimal clearance is required for the spray hea above the structure. Investment and pumping costs are therefore minimised. 31. 8. 78 as 008974 (11pp1370)

*A97 J01 (06.03.79) *DT2514-094 B01d-13*

Liquid to liquid, one phase sepn. of water from aq. mixts. is achieved by contacting an aq. mixt. with the first surface of an organic polymeric membrane selectively permeable to water; permeating a portion of water from aq. mixt. into and through membrane.

A second and opposite surface of the membrane is contacted with a water-miscible sweep liq. of phenol; a water-enriched, miscible phase is withdrawn from the second membrane surface, the miscible phase is thermally adjusted to temp. beyond water-miscibility temp. of phenol; and two liq. phases of water-rich and phenol-rich phases are formed.

Method involves reduced power and heat differential requirements using simple equipment. 1.4.74 as 456719 (4pp931)

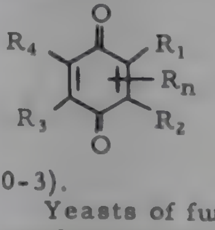
Suppressing bacteria growth in fungus or yeast cultures - usin compsn. contg. a sugar and para:quinone or hemi:quinone derivs.

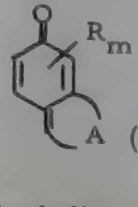
YOUSSEF K A 06.09.77-DT-740013

E14 (08.03.79) C12b-03/16

Compsn. for suppressing bacteria growth in fungus or yeast cultures contains a sugar and either a paraquinone (I) or a hemiquinone (II). In the formulae R's are individu substituents, or a pair(s) of neighbouring R's denotes a fused ring(s); n=0-4. A denotes a fused heterocyclic or carbocyclic ring contg. the marked double bond R's are individual substituents, or a pair of neighbouring R's denote another fused ring; m= 0-3).



(I)



(II)

Yeasts of fungi (including fungi producing antibiotics) can be selectively cultured and yields are increased due to the suppression of bacteria growth. The method is alsc useful for the identification of (including pathogenic species). The method is esp. effective against gram-positive bacteria; the action on gram-negative bacteria is somewhat weaker. 6. 9. 77 as 740013 (26pp70)

MICR- ★ D16 20240B/11 ★DT 2809-759

Bacteria concentrate for fermenting sausages and other meat prods. - contg. Micrococcus varians and lactic acid bacteria, pref. Pediococcus cerevisiae

MICROLIFE TECHNICS 06.09.77-US-830917
(D13) (08.03.79) A22c-11 A23b-04/12 A23l-01/31 C12k-03

Bacteria concentrate contains (a) Micrococcus varians and (b) 0. 01-100 parts (by bacteria w. r. t. Micrococcus) of lactic acid-producing bacteria capable of causing fermentation in meat (pref. Pediococcus cerevisiae strain NRRL-B-5627) with pH lowering to a value from below 5. 4 to above 4. 8. The concentrate contains ⩾10^9 bacteria cells/ml. It is stored at below -20° C, pref. in presence of a freezing stabiliser. After thawing, the concentrate is used in an amt. of pref. 0. 0001-10 wt. % w. r. t. the meat (the concentrate is used in 50-500g. portions). The fermentation temp. is pref. 52° C.

Micrococcus varians improves the taste and colour of the meat, which Pediococcus cerevisial rapidly reduces the pH (this is essential for the process). Red colouration can be produced by addition of up to 200 ppm of an edible nitrite. 7. 3. 78 as 809759 (18pp70)

Beta-lactamase inhibitor prodn. - by cultivating a Streptomyc microorganism and recovering MC 696-SY2-A produced

ZH BISEIBUTSU KAGAKU KEN 29.06.77-JA-076557

B04 (02.02.79) A61k-31/40 C07d-403/02 C07g-07/02 C12 09/14 C12d-13

Prepn. of a β-lactamase inhibitor comprises cultivating microorganism belonging to the genus Streptomyces and capable of forming MC696-SY2 (e.g. MC 696-SY2-A and or -B), specifically Streptomyces fluvobilidis MC 696-SY2 strain (Ferm. P. No. 1504), and separating only the MC 696-SY2-A in the form of a salt, pref. a Ba salt or N salt, from the culture.

Pref. MC 696-SY-2-A in the culture medium is adsor -ed onto a strongly basic cation exchange resin (sulphuri acid type) (e.g. Amberlite IRA-400 or 401 (RTM)) and eluted using an aq. NH_4Cl soln., aq. NaCl soln. or (NH_4 -SO_4 and a crude prod. contg. only MC 696-SY-2A is recovered from the eluate. The crude prod. is purified by passing through a molecular sieve for organic solvents, e.g., a tower contg. a dextran deriv. (e.g. Sephadex G-25 or Sephadex LH-20 (RTM), and developed using an 85 95% aq. methanol soln. or an 85-95% aq. acetonitrile soln., or by passing through a tower contg. silica gel an developing using an 85-95% aq. acetonitrile soln. MC 69 -SY-2A is always recovered as a salt with a mono- or divalent cation. 29. 6. 77 as 076557 (14pp140)

New antibiotic C19-97 is prepd. by cultivating a strain belonging to genus Streptomyces capable of forming antibiotic C19-97 (specifically Streptomyces griseoflavus strain C19-97 (Ferm. P. No. 2297)).

Antibiotic C19-97 exhibits growth inhibitory activity against Gram positive microorganisms and also anticanc activity. 1. 7. 77 as 077740 (9pp140)

TORA ★ D16 20613B/11 ★J5 4015-0

Immobilising enzymes on fibre - by preparing ion-exchange fib based on vinyl aromatic polymer and treating with enzyme soln.

TORAY INDS INC 30.06.77-JA-078300

A97 B04 F06 (A13 A17) (03.02.79) D01f-06/56 D01f-11

Enzyme immobilised on fibre is produced by (1) prepari ion-exchanging fibre, of which the equilibrium water abs -ption capacity is $\nless$ 100% on wt. of dry fibre, from a ble composed of (a) poly (monovinyl aromatic cpd.) and (b) reinforcing polymer (pref. polyalpha-olefin); and (2) trea the ion-exchange fibre with enzyme soln. to effect adso -tion of the enzyme by the fibre.

The fibre-supported immobilised enzyme, can be used in industrial chemical processes, and has excellent mechanical strength and chemical resistance. Even very viscous substrates can be handled without difficulty because of smaller pressure-drop. Deactivated enzyme can be easily replaced by fresh, active enzyme by ordinary desorption-and-readsorption cycles.

In an example, 80 pts. wt. of polystyrene and 20 pts. wt. of polypropylene were blended to prepare a base material. From 50 pts. of the base material (matrix) and 50 pts. of polypropylene (cores), multicore conjugate filaments were prepd. After treating with crosslinking agent (5 pts. paraformaldehyde + 25 pts. acetic acid + 70 pts. conc. H_2SO_4) at 90°C for 4 hrs., the crosslinked filaments were chloromethylated with chloromethylether and $SnCl_4$ and then treated with 30% aq. trimethylamine soln. to obtain strongly basic ion-exchange fibre (equilib. water absorption capacity 100%, anion exchange capacity 2.4 meq/g). The ion-exchange fibre was treated at room temp. for 2 hr. with aq. glucose isomerase extract (contg. 2000 U of enzyme, 0.05 M/l of $NaHCO_3$, 0.01 M/l of $MgCl_2 \cdot 6\,H_2O$; pH 8.2), to obtain the immobilised enzyme. 30. 6. 77 as 078300 (8pp173)

Powdered enzyme prodn. - by extracting solid culture prod., removing low molecular substances by e.g. ultrafiltration and spray drying
SANKYO KK 08.07.77-JA-081675
B04 (08.02.79) A61k-37/48 C07g-07/02

Method comprises extracting the solid culture prod., removing low molecular substances from the extract by reverse osmosis or ultrafiltration and spray-drying the concentrate.

Low molecular substances can be removed effectively by reverse osmosis or ultrafiltration to prevent high viscosity and the treated extract can be easily spray-dried to excellent powdery enzyme.

In an example, 1kg of solid culture prod. is extracted with water to obtain the extract 1.8-2.4 lit. and the extract is concentrated to 1/5-1/15 (1/6-1/10) by reverse osmosis or ultrafiltration. The obtd. powdery enzyme is as good as that prepared by adding salt or organic solvent to the aq. extract of solid culture prod., precipitating the enzyme sepg. it and drying it. 8. 7. 77 as 081675 (3pp5)

L-Glutamic acid prepn. - by culturing Brevibacterium or Corynebacterium bacteria in medium contg. pyrrolidone-5-carboxylic acid
AJINOMOTO KK 07.07.77-JA-081241
B05 E16 (08.02.79) C12d-13/06

The method is characterised by culturing bacteria belonging to Brevibacterium or Corynebacterium in culture medium contg. biotin-active substance > 30µ g/lit. as d-biotin and inhibitor for biotin-activity, adding pyrrolidone-5-carboxylic acid to the culture medium before the multiplication reaches stationary phase for converting it to L-glutamic acid and recovering thus formed L-glutamic acid.

When pyrrolidone carboxylic acid (PCA) is added initially or during the growning period of the bacteria, D- and L-PCA can be converted to L-glutamic acid with conversion rate 100%.

Specifically, Brevibacterium flavum ATCC 14067, B. lactofermentum ATCC 13869, B. divaricatum ATCC 14020, Corynobacterium glutamicum ATCC 13032, C. acetoacidophilum ATCC 13870, etc. can be used and the culture practiced at 24-37°C at pH 6-9 aerobically. The inhibitor for biotin activity prevents L-glutamic acid fermentation. As the inhibitor, penicillin and surfactant such as higher satd. fatty acid, its ester, etc. can be used. As biotin-active substance, biotin, desthiobiotin, 7,8-diamino-pelargonic acid, d-biotinsulphoxide, etc. can be used. 7. 7. 77 as 081241 (4pp5)

Determining peroxidase activity - by carrying out enzymatic reaction in acid conditions in the presence of protein or peptide and determining fluorescent activity
AJINOMOTO KK 11.07.77-JA-082703
B04 J04 R16 (09.02.79) G01n-31/14 G01n-33/16

Determining the activity of peroxidase comprises carrying out enzymatic reaction in acid conditions and in the presence of protein or peptide having no peroxidase activity. The activity of peroxidase is determined by fluorescent analytical method.

The enzymatic reaction is carried out in acidity, esp. at pH 3. 5-5. 0. Protein having no peroxidase activity is e. g. serum albumin, serum globulin, casein, gelatin, egg lysozyme, etc., usually boving albumin. The amt. of protein or peptide having no peroxidase activity used can be as small as some μg. or more in each test tube for the determn. Peptide used is partial hydrolysate of protein, chemically synthesised straight chain or cyclic peptide, peptide system antibiotics, etc. The enzymatic reaction mixt. is finally subjected to the determn. of the fluorescent intensity by a spectrophotofluorometer.

The activity of peroxidase is determined with high sensitivity, high accuracy and very high reproducibility c. f. previous methods such as Gilbert's method. 11. 7. 77 as 082703 (6pp50)

Electric cooker for starch slurries - operates by passing current through slurry

CUNNINGHAM N T 21.04.77-US-789702 (04.12.75-US-637865)
(22.08.78) A23l-01 C12c-11

Appts. for cooking a slurry of cereal grains consists of an electrically conducting tube, having inlet and outlet ends, surrounding a co-axial central electrode, with supports at the inlet end. An AC power source is connected between the electrode and the tube.

The appts. is intended for use in the ethanol prodn. process claimed in U.S. 4035515, in which cereal starch is gelled by rapid heating before any enzymatic or microbial action can occur, and then treated with maltase prior to fermentation. This enables starch to be used more efficiently, and increases the yield of ethanol. 21.4.77 as 789702 C.i.p. 4035515 (10pp955).

Filter contains $\geqslant 1$ layer of a fibrous material (e.g. cellulose acetate fibres) and $\geqslant 1$ layer of synthetic mica (10-200 wt.% w.r.t. the fibres); alternatively the mica particles (4-100 mesh) are dispersed in the fibre matrix.

The synthetic mica contained inthe filter material has high adsorptivity with respect to nicotine, tar, acetaldehyde and minute solid particles contained in the tobacco smoke. The aroma and taste of the tobacco is not affected. 7.7.78 as 830049 (17pp70)

PATP- ★ D18 20291B/11 ★DT 2837-571
Flat material drying machine - with heated jacketed drum and sealed membrane strip
PATPAN INC 26.01.78-GB-003132 (02.09.77-CH-010706)
J08 Q76 (08.03.79) C14b-01/58 F26b-09/06

A machine to dry porous flat pieces of material under a vacuum consists of a heated jacketed drum against which a driving jockey pulley rests. A flexible airtight membrane which is fixed at one end to the drum and at the other end to the pulley carries a porous cushion layer, surrounded by a sealing strip, on the drum side. The material to be dried can be rolled inside and a vacuum is applied.

The machine is simple and compact and needs little space for handling. Adjustments are easily made. 29.8.78 as 837571 (35pp39)

JOBB ★ D18 20325B/11 ★FR 2393-542
Composite triple filter for cigarettes or cigars - has finely divided active carbon or carbon fibres increasing efficiency
SOC JOB 10.06.77-FR-017871
P15 (09.02.79) A24b-15/02 A24d-01/06

Very fine synthetic or artificial fibres having a morphology similar to cellulosic fibres fibrillised by continuous processing, are introduced into a central chamber between two coaxial filtration tampons, to form a composite filter for cigarettes and cigars; the intrinsic structure of the fibres being maintained.

Before the fibres are introduced into the central chamber or whilst the introduction is taking place, the synthetic or artificial fibres are pref. mixed with a finely divided absorbent material. This may be granulated active carbon or consist of fibres of active carbon.

The aerated structure of the carbon fibres increases the efficiency of each of the components cf. their performance separately. 10.6.77 as 017871 (4pp1014)

HARR/ ★ D18 20359B/11 ★FR 2393-883
Disposable holder for cigarette is exposed during smoking - and consists of non-flammable thread rolled in paper
HARRINGTON D E 07.06.77-FR-017315
F09 (09.02.79) D21h-05/16

A paper for a cigarette is in the form of a thin band along which a very thin uninflammable support is fixed. The support may be glued to the paper in the lengthways direction of a cigarette, and it exposes itself progressively as the cigarette is smoked and consumed, so that the cigarette can be manipulated by it.

The paper is in the form of a sheet of the normal length and breadth approximately, the support being fixed longitudinally. The support is fixed to one edge of the paper by which it is enclosed. The support may be formed by a thread which is glued to the paper.

Support is quite cheap and causes no inconvenience since it is disposed of. 7.6.77 as 017315 (8pp1014)

OREA ★ D21 20012B/11 ★BE -870-248
Hair dyeing compsn. contg. specified cationic polymer - fatty acid, alkali, benzyl alcohol and oxidn. dye
L'OREAL SA 15.06.78-FR-017900 (07.09.77-FR-027096)
A96 E19 (06.03.79) A61k

The compsn. to dilute with an oxidising soln. contains ⩾ 1 oxidn. colourant and a support comprising 1 fatty acid, ⩾ 1 alkalising agent in stoichiometric excess to the acid, 2-20% benzylalcohol and 1-15% of ⩾1 cationic polymer constituted by moieties of formula:- $X^- -N^{\oplus}(R_1)(R_3)-A-N^{\oplus}-(R_2)(R_4)-B-X^-$.

In the formula R_1 and R_2 are 1-3C alkyl; R_3 and R_4 are 1-3C alkyl or hydroxyalkyl, also R_2 and R_4 can be 4-8C alkyl when $R_1=R_3=CH_3$ and in this case $R_2=R_4$; also R_4 can be benzyl, cyclohexyl or 4-12C alkyl when $R_1=R_2=R_3=CH_3$; A and B independently are 2-20C alkylene or alkenylene, $-(CH_2)_n-O-(CH_2)_n-$, $-(CH_2)_m-NHCONH(CH_2)_m-$, $-CH_2-CH(OH)-CH_2-$ or $-CH_2-$phenyl$-CH_2-$in which n and m are 2 or 3; and X is an anion.

The compsns. are less injurious to the hair than known prods. They give an excellent untangling effect and give the dry hair a pleasant moist feel. After colouration the hair is full, vibrant, shiny and non-electric, with excell- ent dyeing. 6.9.78 as 870248 (41pp597)

The cpd. or compsn. which can increase pH of the compsn. at high temp. is borax, calcium hydrogen tartarate, sodium phos-phate or mixt. of ammonia and ammonium chloride. It is used in amt. 0.005-5 pts. wt. per 100 pts. wt. compsn Prior to addition it is pref. to adjust pH of the cpd. or th compsn. to neutral with aq. ammonia or organic acid suc as oxalic acid.

The hair treating compsn. contains 1-15%

cpd. such as cysteine, acetylcysteine, etc. as the major ingredient and usually contains surfactant such as polyo-ethylenelaurylether, etc., emollient such as ethyleneglycol, silicone oil, etc., antioxidant, perfume, colourant, etc. 30. 6. 77 as 078871 (2pp5)

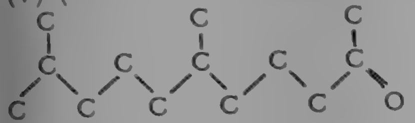
KURS ★ D21 20559B/11 ★J5 4014-902

Squalane prodn. from 13C-ketone - which is obtd. by hydrogenating unsatd. ketone(s) obtd. from a propargyl-type alcohol

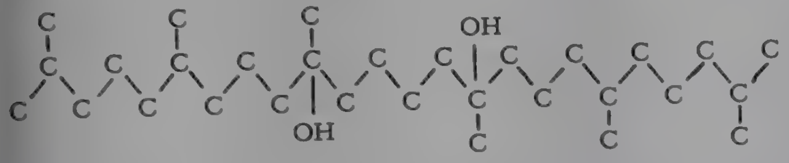
KURARAY KK 06.07.77-JA-081258

E17 (03.02.79) C07c-01/20 C07c-09/16 C07c-45 C07c-49/20

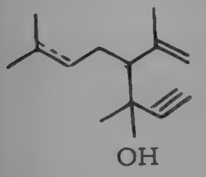
Squalane is produced from unsatd. C_{30}-diol having a frame (II) obtd. from opt. unsatd. C_{13}-ketone having a frame (I). The C_{13}-ketone is produced by hydrogenating unsatd. ketone (IV-1) and (IV-2) obtd. by heating propargyl-type alcohol of formula (III) and C_{13}-ketone is represented by formula (V) (dotted lines indicate optional double bonds).



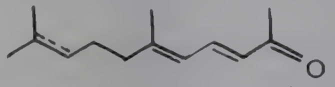
(I)



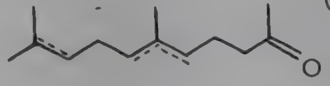
(II)



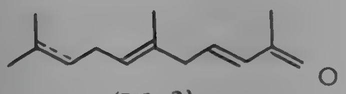
(III)



(IV-1)



(V)



(IV-2)

Propargyl-type alcohol is produced easily from cheap raw material and it is changed into unsaturated ketone (IV-1) and (IV-2) by only heating. Therefore, by combining with the rearrangement process of propargyl-type alcohol, the industrial value of usual squalane prodn. is raised. Squalane is useful as a basic material of toiletry goods and lubricating oil of precision machine. 6. 7. 77 as 081258 (9pp78)

LIOY ★ D21 20751B/11 ★J5 4015-912

Shampoo compsn. - contg. sodium on potassium salt or anionic surfactant, cationic polymer and lanolin (deriv.)

LION FAT & OIL KK 24.06.77-JA-075299

A96 (06.02.79) A61k-07/06 C11d-10/02

Shampoo compsn. comprises 1-50 wt. % anionic surface active agent of Na salt type, K salt type or alkanolamine type; 0. 1-5 wt. % cationic polymer; and 0. 1-10 wt. % lano-line (deriv.).

Compsn. is suitable for the cleaning of hair and skin. Flaking of hair after shampoo is prevented, and the compsn has a favourable hair conditioning effect.

Specifically the surfactant is ≥1 Na-, K- or alkanolamine salt of tallow fatty acid, lauric acid and synthetic higher fatty acid, R-$(OR')_nOSO_3M$, R-SO_3M and OS-M (R is 8-18C alkyl or alkylphenyl replaced by alkyl of 6-15C, R' is 2-3C alkylene, n is 0-6, M is Na, K, alkanolamine). Pref. cationic polymers are derivs. of quat.-nitrogen substituted cellulose ether, derivs. of quat-nitrogen contg. polytrialkylalkylaminoethylmethacrylate, water soluble polytrialkylalkylaminoethylmethacrylate, water soluble cationic polymer of tetraethylenepentamine-epichlorhydrin, cationic polymer of tetraethylenepentamine-epichlorhydrin, quat.-nitrogen contg. polyvinylpyrrolidone, polyethyleneimine, etc. 24. 6. 77 as 075299 (5pp170)

KANE ★ D21 20997B/11 ★J5 4017-136

Creamy hair dressing compsn. - contains propylene oxide-ethylene oxide adduct with higher alcohol, higher fatty acid salt, oily substance and water

KANEBO KK 18.06.77-JA-072308

A96 E17 (E12) (08.02.79) A61k-07/11

The compsn. contains (a) 14-45 w/w% propyleneoxide-ethyleneoxide co-adduct with straight chained aliphatic higher alcohol $RO(CH_2CHCH_2O)_n(CH_2CH_2O)_mH$ (I), (b) 0.5-6.0 w/w% of higher fatty acid alkali salt (c) 3-14 w/w% of the oily substance which is solid or pasty at 20 °C and (d) 51.5-81.5 w/w % water.

In (I) R is 12-22C alkyl group alkenyl group. n : integer 10-100. m is a number satisfying following inequality (II).

$$3 \leqslant \frac{\text{(molecular weight of } (CH_2CH_2O)) \text{ x m x 100}}{\text{molecular weight of the compound (I)}} \leqslant 15 \quad \text{(II)}$$

The compsn. is excellent in preservative property, touch, hair-dressing activity, emollient activity and rinsing property and hardly corrodes nitrocellulose articles such as spectacle frames, combs, etc.

As the component (b) Na salt, K salt, ammonium salt or alkanolamine salt of lauric acid, myristic acid, palmitic acid, stearic acid, etc. can be applied. 18. 6. 77 as 072308 (9pp5)

BIOP= ★ D21 21242B/11 ★SU -241-429

Synthesis of amino-thiol radiation protective agents - by reacting halo-alkylamine hydrochloride with sodium thiosulphate, hydrolysis with sodium sulphide, and steam distillation or pptn.

BIOPHYSICS INST 20.07.67-SU-173284

Surgical suture package - with folded holder card inside inner bag for easy access to contents

AMERICAN CYANAMID CO 16.05.77-US-797216
*P34 +P31 (06.03.79) *DT2820-257 A61l-17/02*

A direct dispensing multi-needle surgical suture package comprises a strand cover flap with tandem score lines and on one side of a back panel, a notch in the flap top adjacent the panel and a label cover flap at the panel bottom containing tandem score lines.

A diagonal cut connects the bottom and a side of the label flap. A side flap adjacent and connected to the label flap and opposite the cut has score lines. The strand flap is folded on its score lines onto the panel, and needled strands held together by a tab are contained between panel and strand flap with the tab and needled suture ends placed on the notch. The label flap is folded onto the strand flap which is folded under the panel so that when the tab is lifted the sutures are directly dispersed. 16.5.77 as

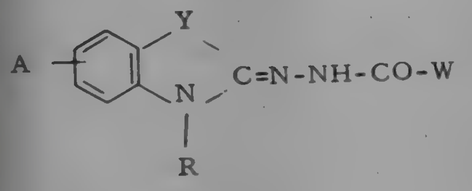
Powdery detergent mixt. for textiles - contg. hydrazone blueing dye intermediate converted to brightening azo dye on oxidn.

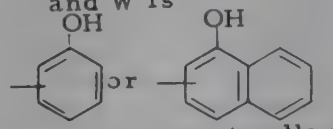
KAO SOAP KK 29.11.73-JA-134511

*E13 (08.03.79) *DT2456-212 C11d-03/40*

A powdery detergent for washing textiles contains an organic surfactant, a builder, ⩾ 1 intermediate (I) of a blueing dye and ⩾ 1 cpd. (II) releasing active chlorine on contact with water to convert I to the dye itself. The dye has the formula:



(where A is H, halogen, $-CH_3$, $-OCH_3$, $-SO_3H$ or $-SO_3Na$; Y is S, O, -NR- or -C=C-; R is $-CH_3$ or $-C_2H_5$ and W is



)

The amt. of I present is sufficient to prevent yellowing of the textiles. The amt. of II present is sufficient to convert I to the dye. 28.11.74. as 456212 (6pp068)

KAOS D25 00458X/01 =DS 2524-785

Coloured liquid cleaning compsn - stabilised to colour change by substd cresole/anisole

KAO SOAP KK 07.06.74-JA-064629

*A97 E15 (08.03.79) *DT2524-785 C11d-03/40*

A coloured, liquid detergent mixt. contains an anionic surfactant contg. a sulphate or sulphonate gp, a coal tar dye and 0.02-1.0 wt.% (based on wt. of anionic surfactant) of butylated hydroxytoluene (I) or butylated hydroxyvarisole (II).

Cpds. I and II are known antioxidants and prevent the detergent losing colour on storage. The detergent mixt. is used for cosmetic and pharmaceutical applications, e.g. dishwashing shampoos, heavy duty detergents, etc. 4.6.75. as 524785 (9pp068)

KALI D25 38650A/22 =DS 2652-488

Granulate builders for cleansing and detergent compsns. - prepd. from zeolite and oxygen-generating cpd. in presence of water

KALI-CHEMIE AG 18.11.76-DT-652488

*A97 E37 (08.03.79) *DT2652-488 C11d-03/12*

Storage-stable granules of zeolites and cpds. (I) releasing oxygen, e.g. sodium peroxoborate or sodium carbonate peroxohydrate are prepd. The zeolite and solid cpd I are granulated in the presence of water, e.g. 2-35 wt.% water, and then dried, pref. in a vortical bed drier at 30-70°C.

The granules are useful as components of cleaning or detergent mixts. 18.11.76. as 652488 (4pp068)

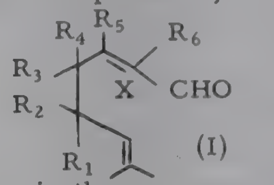
Hydrogenation of citral to citronellal and/or citronellol - using chromium promoted Raney nickel catalyst

RHONE-POULENC INDUSTRIES (RHOD-) 17.02.76-US-658788

*E17 (14.03.79) *US4029-709 C07c-27/04 C07c-33/02 C07c-47/20*

Ethylenic aldehydes (I) are hydrogenated to corresp. aldehydes in which the double bond X is satd. and/or to corresp. ethylenic alcohols, in which X is satd. and the CHO gp. is replaced by a CH_2OH gp. In the formula R_1, R_2, R_3, R_4 and R_6 are H or (un)branched alkyl and R_5 is (un)branched alkyl. Reaction is effected using a Raney Ni catalyst activated by Cr.



(I)

Pref. hydrogenation is carried out at 5-200°C at 0.15-35 kg/cm² pressure in the presence of 1-4C aliphatic alcohol as inert solvent present to 10-100 wt % w.r.t. aldehyde.

Used esp. for converting citral to citronellal, thence to citronellol, a constituent naturally in plants of the Rosaceae family. 16.2.77 as 006510 (10pp931)

HEND- D25 10687A/06 =GB 1542-027

General purpose cleaning compsn. - contains a vinyl acetate copolymer to facilitate removal of the residue after letting the compsn. dry on the cleaned surface

HENDRICKS & SOMMER 29.07.76-OE-005597

*(14.03.79) *DT2733-619 C11d-03/37*

Cleaning agent comprises 100 wt. pts. wash-active substance in aq. soln. 0-60 wt. pts. polyphosphate, 0-100 wt. pts. 1-6C aliphatic alcohol, 100-1000 wt. pts. vinylacetate homo-polymer or copolymer having MFT of 17-70°C dispersed in aq. medium.

Pref. copolymer is vinylacetate/methyl methacrylate co-polymer contg. protective colloid in copolymerised form, copolymer additionally contains 0.5-12 wt % w.r.t. copolymer of α, β-monoethylenically unsatd. carboxylic acid in copolymerised form.

Compsn. is esp. suitable for domestic, industrial and professional use. 29.7.77 as 031935 (6pp931)

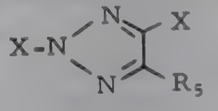
Bis-stilbenyl-(v)-triazole cpds. - useful optical brightening agents for polyesters, polyamides, cellulose fibres, etc.

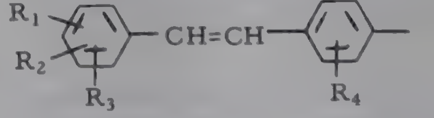
CIBA GEIGY AG 28.01.77-CH-001071 (02.06.76-CH-006933)

*A60 E23 F06 (14.03.79) *DT2724-408 C07d-249/06 C08k-05/34 D06l-03/12 + C07f-09/65*

2,4-Bis-(stilbene-4'-yl)-v-triazole cpds. of formula (I) are claimed. In (I), X is a gp. of formula (II). Each R_1 is H, sulphonic acid (salt, ester or amide)carboxylic acid (salt, ester or amide), CN, halogen, (un)substd. alkylsulphonyl, arylsulphonyl, (cyclo)alkyl, (ar)alkoxy, aralkyl or aryl (oxy), or(un)substd. 5-membered heterocycle contg. 2-3 N atoms or one O atom and 1 or 2 N atoms.



(I)



(II)

Each R_2 is H, sulphonic acid (salt, ester or amide), carboxylic acid (salt, ester or amide), CN, halogen or (un)substd. alkyl or alkoxy. The two R_1 gps. and the two R_2 gps. may form (m)ethylenedioxy, methylenoxymethylenoxy, tri- or tetra-methylene, propylene, butenylene or butadienylene.

Each R_3 is H, halogen or (un)substd. alkyl. Each R_4 is H halogen, CN, sulphonic acid (salt, ester or amide), or carboxylic acid (salt, ester or amide), R_5 is H, halogen, CN, sulphonic acid (salt, ester or amide), carboxylic acid (salt ester or amide), (un)substd. alkyl, aryl, aralkyl or styryl, or the gp. $-CH_2OZ$ in which Z is H or (un)substd. aroyl or alkanoyl.

(I) are optical brighteners for synthetic, regenerated man-made or natural organic materials. 31.5.77 as 023004 (22pp992)

ICIL ★ D25 20424B/11 ★GB 2003-522
Hypochlorite bleaching and cleaning compsn. - contg. branched chain tert. alkylamine oxide as thickener
IMPERIAL CHEM INDS LTD 04.08.78-GB-032218 (02.09.77-GB-036713)
E16 (14.03.79) C11d-01/75 C11d-07/54 D06l-03/06

Cleaning and bleaching compsn. comprises water, an alkali metal hypochlorite and amine oxide of formula $R.CHR_1.-CH_2N(R_2)R_3)\rightarrow O$ (I) (R = linear 5-17C alkyl, R_1 is 1-3C alkyl, esp. methyl and the $R.CHR_1CH_2$- gp. contains 8-20C R_2 and R_3 = 1-6C alkyl, pref. CH_3).

Suitably a mixt. of (I) plus linear amine oxides of formula $RCH_2CH_2N(R_2R_3)\rightarrow O$ (II) is used at wt. ratio 40-60-60-40, esp. a mixt. of 65-75 wt % 13C and 35-25 wt % 15C amine oxides with about 50% linear and 50% 2-alkyl(methyl) branched chain. (The C numbers refer to $RCHR_1CH_2$- only).

Used for cleaning fabrics and general disinfectant purposes. (I) increase the viscosity of the formulation more efficiently than commercial amine oxides. 4.8.78 as 032218 (5pp1251)

KOBA/ ★ D25 20718B/11 ★J5 4015-485
Cream-like compsn. for removing rust from metals, dirt from tiles etc. - contains dilute sulphuric acid, viscosity adjusting agent, e.g. colloidal silica or PVP and powdered abrasive
KOBAYASHI M 06.07.77-JA-079809
A97 G04 M12 (05.02.79) C11d-17 C23g-01

The compsn. comprises aq. dil. H_2SO_4 soln. (6-10%), a viscosity-adjusting agent, e.g. colloidal silica, PVP etc., and a powdered abrasive, e.g. fused alumina, emery, silicon carbide, garnet, etc. Opt. non-oxidising inorganic acid, e.g. HCl, H_3PO_4 etc. or organic acid, e.g. oxalic acid, sulfamic acid, citric acid, and gluconic acid etc. may be used in combination with the aq. dil. H_2SO_4 soln.

In an example, 0.5% of an alkylphenolpolyoxyethylene ether surfactants was added to 9%-dil. H_2SO_4 soln. to afford permeability, after which 20 wt. % of colloidal silica is suspended, followed by adding 40 wt. % of powdered fused Al_2O_3 to give a product. 6.7.77 as 079809 (2pp34)

MIYO ★ D25 20901B/11 ★J5 4016-513
Detergent compsn. - comprising sodium soap, potassium soap and organic amine soap of synthetic fatty acid mixt. and natural fatty acid mixt.
MIYOSHI YUSHI KK 08.07.77-JA-080926
(07.02.79) C11d-09/02

The synthetic fatty acid mixt. contains 55-70 wt. % 14-16C fatty acids with 30-50 wt. % being satd. fatty acids branched at the α-position, among the mixt. of straight chain and branched chain satd. fatty acids derived by the Oxo process The natural fatty acid mixt. contains oleic acid as essential component. The proportion of the synthetic fatty acid mixt. in the total fatty acid compsn. of the detergent is 5-90 wt. %.

The fatty acid soap is storage stable, has high solubility at low temp. and high foam generating property. Generation of scum by coagulation of the insoluble soap is slight. Only mild skin irritation is experienced. 8.7.77 as 080926 (6pp126)

UNIL ★ D25 21208B/11 ★NL 7808-640
Coloured specks for addn. to washing powders - by agglomerating cyclone dust from washing powder mfr. with a coloured agglomerating agent
UNILEVER NV 22.08.77-GB-035090
A97 (26.02.79) C11d-17/06

Coloured specks for use in soap- and washing powders are comprised of fine particles sepd. from a gas stream resulting from the prodn. of spray dried soap- or washing powder, and agglomerated with a coloured agglomerating agent

Pref. the fine particles have a particle size of <200μ and are sepd. in a cyclone separator. The agglomerating agent used is e.g. Na silicate, a non-ionic surfactant, a fatty acid, a cellulose deriv. or a mixt. of these, and the agglomerated particles have a dia. of 400-1500μ.

Process is economical to operate and uses cyclone dust from the washing powder prodn. process. The specks formed are evenly coloured, are visually detectable and do not separate out of the prod. 22.8.78 as 008640 (11pp513)

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals
C	Agricultural Chemistry
D	Food, Disinfectants, Detergents
E	General Chemistry
E+	General Chemistry Applns.
F	Textiles, Paper, Cellulose
G	Printing, Coating, Photographic Chemistry
H	Petroleum
J	Chemical Engineering
K	Nucleonics, Explosives, Protection
L	Refractories, Ceramics
M	Metallurgy

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

PAUL/ D11 74430Y/42 =DS 2714-761
Rotary oven for heating prepd. pizzas - has helical path and coaxial rotor to propel and rotate pizzas
PAULUCCI J F 02.04.76-US-672849
*+P28 (15.03.79) *DT2714-761 A21b-01/42*

A high temp. oven for baking pizzas in hot air consists of a structure in which a helical strip with a small outer rim is fixed to form a spiral chute. The width of the strip is smaller than the dia. of the baking tin for a pizza so that the tins protrude into the central free space. A drive mechanism, arranged in the latter, consists of three vertical rods which keep three pizza tins pressed close to the outer rim as they move them along the spiral. Internal blockages are prevented. 1.4.77. as 714761 Div. in 2759302 (10pp39)

HAFE/ ★ D11 22153B/12 ★DS 2804-795
Brine treated pastry baking - with one of two non-greased baking plates for dipping and one for baking
HAFELE J 04.02.78-DT-804795
(15.03.79) A21d-08/06

Pastry articles such as crusty rolls are dipped into a brine solution on a perforated baking plate and allowed to drip. After covering by a sheet of baking paper a second baking plate, like the first not coated with fat, is laid over and the plates are turned over to transfer the rolls to the second plate for insertion in the oven.

This prevents the contamination of the brine bath by the fat coating of the baking plate in the conventional system. Brine cannot enter the oven and contaminate it. 4.2.78. as 804795 (4pp39)

MCDA/ ★ D11 23906B/12 ★US 4144-356
Deep fried doughnut on stick - with dough remaining tacky and uncooked to retain adhesion to stick
MCDANIEL D G 25.04.77-US-790548
(13.03.79) A21d-08

A holding stick is inserted into tacky dough which adheres tothe stick when uncooked, then the dough is immersed in hot deep fat so that the dough exterior fries quickly while dough contacting the stick remains uncooked and adherent.

The dough on the stick is pref. proofed in moist air at 115°F for 45 min. before frying in fat at 375°F. The dough is pref. cooled after frying and is then iced. The dough may be of elongate shape or a number of dough portions may be carried on the stick. 25.4.77 as 790548 (4pp)

TIVE- ★ D12 22039B/12 ★BE -870-429
Moulding sausages etc. with coherent skin-like surfaces - not requiring either edible or inedible casings
TIVET DEVELOPMENTS 14.09.77-GB-038395
(13.03.79) A22c A23p

In the mfr. of a food prod. moulded from a paste contg. meat or similar protein material, and of which the surface is treated with a fluid. Moulding is carried out under pressure in a rigid mould cavity having a permeable wall through which the fluid for surface treatment is introduced. The permeable wall is pref. contained inside an impermeable casing in which the fluid is pressurised to drive it through the permeable wall.

Introduction of pressurised fluid to the mould cavity is pref. simultaneous with compression moulding of the prod. The fluid pref. reacts with the surface of the prod. to form a coherent, skin-like surface. The fluid is pref. an edible acid, e.g. an organic acid such as acetic, malic, ascorbic, citric or an inorganic acid such as hydrochloric or phosphoric. The acid is used as an aqueous soln. with a pH value of 1.0-3.0, pref. 1.5-2.5. Mould pressure is pref. applied by a piston moving into the mould cavity. 13.9.78 as 870429 (30pp448)

BECK- D12 53170V/29 =DS 2358-560
Laminated tubular film for packaging cookable sausage - having inner layer of thermoplastic material with low water absorbtion, and outer water absorbing layer
NATURIN-WERK BECKER (NATW) 24.11.73-DT-358560
*A97 P73 (A94) (15.03.79) *NL7317-788 A22c-13*

A double layered casing for sausage is made using 11 or 12 for the inner layer which does not absorb water and polyamide 6, polyamide 6,6, polyamide 4 or polyvinyl for the outer layer which does absorb water. The polymers are coextruded to a tube with a thickness ratio of inner to outer layer of 1:1-6. The outside of the finished tube is treated with acid, e.g. dil. HCl, to increase water absorption.

The sausage shape is fault free after heating and cooling. 24.11.73. as 358560 (6pp068)

NMHB ★ D12 22154B/12 ★DS 2832-329
Fish filleting machine - saves topping operation by rib cutters producing inclined cut
NORDISCH MASCH R BAADER 22.07.78-DT-832329
(15.03.79) A22c-25/16

Fillets are prepd. from fish which have not been topped or are complete with supraclavicula by central fillet cuts, dorsal fillet cuts and rib cuts. Head and/or collar bone are left on the fishbone framework when the fillets are cut free by parting cuts which run close behind the supraclavicula and at an angle to the roof of the cranium.

Process saves the cost for a topping machine and the labour cost for its operator. This has an economical effect specially for the processing of small fish. 22.7.78. as 832329 (4pp39)

NMHB ★ D12 22248B/12 ★DT 2740-459
Fish position device - with pivoted guide rod pair for contra-rotating endless belts
NORDISCH MASCH R BAADER 08.09.77-DT-740459
(15.03.79) A22c-25/12

A device to position fish at the same height for a following processing machine consists of two parallel guide rods which leave a gap between them and are opened out at the incoming end. They run for a short distance just below the bottom edge of the contrarotating belt conveyors to which the fish is transferred.

This device can deal with plump as well as with slender and gutted fish which are fed to the processing machine in the same uniform height. 8.9.77 as 740459. (10pp39)

LABA/ ★ D12 22434B/12 ★FR 2394-249

Poultry feather plucking machine - eliminates manual operation without damage to skin or flesh of prod.

LABADIE G 14.10.76-FR-031798

(16.02.79) A22c-21/02

The machine comprises rotors turning at about 160rpm to pull out and dispose of the feathers. A first set of rotors pref. comprises a pair of parallel shafts, contra-rotating at 160 rpm. Flexible beater blades extend from each shaft to overlap radially those of the other shaft. The neck and head of a bird is pushed between the sets of blades.

A second set of rotors pref. comprises a resilient, e.g. rubber, flat band lapping a roller and nipped against it by a similar, contra-rotating roller. Body feathers are pulled out by the nip and conveyed away by the band.

Used in plucking poultry for meat, partic. for canning factories. 14.10.76 as 031798 (8pp448)

YOUN- ★ D12 22474B/12 ★GB 1542-403

Appts. for deveining crustacea clamped in indexable holders - by application of suction to deveining needles with subsequent ejection of meat from shells

YOUNGS SEAFOODS LTD 15.07.75-GB-029631

(21.03.79) A22c-29/02

Appts. for deveining crustacea includes a device for holding a crustacean and a pilot needle for insertion into the crustacean. A hollow deveining needle can be guided through the pilot needle for the applicn. of suction in order to remove a vein.

Pressurised air and water is used to blow out the meat from the shell after the deveining needle has been withdrawn. Each holder is cam-actuated in its operation and has two clamping jaws, one of which being a spring-urged foam pad. The other has a recess corresponding in shape to the crustacean.

Used in obtaining edible meat from shrimps and prawns e.g. scampi. The sand vein removal is efficient and the meat is generally ejected as an integral piece rather than in bits or shreds. The holders are arranged to clamp the crustacea under different pressures depending upon the operation concerned. Very few manual operations are required. 15.7.75 as 029631 (9pp1044)

TEKH= ★ D12 23443B/12 ★SU -568-427

Fish-washing equipment - has U/shaped pipe through which water and fish pass before being ejected on to water separating trough

TEKHRYBPROM 30.12.75-SU-307605

(18.01.78) A22c-25/02

Washing device for fish and other sea-prods., including fish cut into pieces, krill and krill pastes, for ship and shore use, comprise vertically-positioned U-shaped pipe with the unloading end below the loading end. In the latter is a water-feed pipe and a sloping water-separator.

Process is intensified and damage to product is avoided by putting a cylindrical insert into the loading section, the end being lower than the water-feed pipe.

The unloading end of the pipe is bevelled, with an angle equal to the angle at which the water-separator slopes. The water-feed pipe is above the bevelled end and deflectors are added to the unloading pipe as two flaps at 60-90° to one another in the direction the flow is moving.

Piletskii M.M., Svoyanovskii V.I., Subbotin A.A. et al Bul. 30/15.8.77 30.12.75 as 307605 (3pp29)

LERO= ★ D12 23468B/12 ★SU -604-549

Pedal operated sausage filling injector - has combined feeding equipment and rotating stopper in injection head, to hold the mea when filled skin is removed

LENGD ROSREMMEKHPRO 04.01.76-SU-309099

(25.04.78) A22c-11/08

Injector to fill sausage skins with meat, etc., includes a screw displacer with loading hopper, sausage meat pipe with end teat, vacuum system, meat cut-off and drive. Outflow of meat from the teat, on completion of skin filling, is prevented by adding a container which abuts against the meat cut-off. Inside the container is a shaft with a disc and a magazine with a helical spring. The cut-off is a cylindrical plug with a hole which is mounted between the meat pipe and the end teat. The plug can rotate and one end of the spring is connected to the shaft and the other end to the magazine.

Odintsov V.P., Kornyushko L.M., Bul. 16/30.4.78 4.1.76 as 309099 (4pp29)

KCEN- ★ D12 23683B/12 ★US 4143-444

Opening oyster shells - using appts. which applies opposed shearing forces adjacent shell joint

KC ENTERPRISES 01.03.77-US-773187

(13.03.79) A22c-29/04

Appts. for opening an oyster includes an oyster-carrying flight which has a leading edge engaging one half of the oyster shell. The flight moves to transport the oyster towards a concussion barrier. The barrier spans the path of the flight so that the barrier is struck by the other half of the oyster shell. This applies an abrupt shearing jolt to the oyster.

The barrier may be raised relative to the flight path. A sensor is activated by the advancing oyster so that the barrier is moving away from the flight path while it is engaged by the oyster.

The apparatus can be adjusted to accommodate oysters of different types. The appts. provided minimum mutilation of the oyster meat. 1.3.77 as 773187 (15pp295).

PROV= D12 04701A/03 =US 4143-591

Solid particles condensed from fish roe soln. or suspension - with thorough cooling and forced circulation of cooling liquid

PROVISIONS EQUIP 28.06.76-SU-378188

*(13.03.79) *DT2729-094 +A23c-09/02*

Granular food prods. are produced from solns. or suspensions using a device including a heated chamber for keeping the suspension under pressure and having circumferentially spaced holes in the bottom; a rotatable disc in the chamber bottom having corresp. holes; an insulating spacer under the chamber having corresp. nozzles; a cooled liquid-contg. vessel under the spacer in the form of a heat exchanger for receiving granules the tubes of which each contact one nozzle; a pipe for feeding the liquid through annular gaps between the nozzles and tubes to the tubes, and a pipe for removing the liquid and granules from the vessel. 20.6.77 as 808389 (8pp1376).

CHEN/ ★ D13 22119B/12 ★CA 1049-799

Freezing food while suspended in cold gas stream - moving up column while food descends

CHENEY P L 23.03.77-CA-274535 (28.07.75-CA-232384)

Q75 (06.03.79) F25d-13/06

Food is frozen by introducing it at the top of a hollow column up which a stream of refrigerating gas is passed. The gas velocity is insufficient to support the food and this drops through the column and collects on an annular transfer trough at the base of the column. Concentric with the first column is a second column and refrigerating gas moves upwards through the second column at a higher vel city to raise food from the transfer trough and carry upwards through the column.

In an embodiment the apparatus includes a third column ncentric with the others and having a low velocity gas ow. Food from the top of the second column is transfe- red to the top of the third column and descends against n upwards gas stream.

The apparatus freezes food eg peas. 23.3.77 as 274535 iv. ex 28.7.75-232384 (31pp295)

NEUMAIER R 30.08.77-DT-759347 (00.00.77-DT-717193)

C03 (15.03.79) A23k-01/12

Fermentation of straw to produce animal foodstuffs comprises moistening the straw with a 3-5% soln. of yeast, as in the parent patent. The moistening soln. also contains starch contg. materials (I). Pref. it contains molasses and/or sugar.

(I) reduces the fermentation time. After 24 hrs. a digestible protein content of 7.5% is obtd., 90% of this value is reached after 12 hrs. 30.8.77 as 759347, Add. to 2717193. (4pp903)

FARM- ★ D13 22280B/12 ★DT 2812-920

Whole wheat grain fractionation - to gluten, starch, bran and germ; by soaking, grinding hydration and washing (NL 13.3.79)

FAR-MAR-CO INC 09.09.77-US-831905

(D11) (15.03.79) A21d-06 A23j-01/12

Fractionation of whole wheat grains into a gluten- and non-gluten component of endosperm comprises first soaking in water to moisture content 14wt.% up to satn. pt., pref. 14-22(14-18)wt.%. The grains are then ground to flakes of thickness 0.0013-0.64mm.

The flakes are then ground to bran-, germ- and endosperm-particles, provided the bran and germ particles are larger than the endosperm particles. Size distribution of the bran, germ and endosperm particles is such that 25-75(40-60) esp. 50% of particles are retained by a 50 mesh screen.

The particles are hydrated in an additional water quantity, corresponding to 65-85wt.% of particles and which is just sufficient to achieve a satn. moisture content. Particles and water are moved to form a stiff dough. Most of endosperm particles are washed out from dough with water e.g. at 15-32°C, to leave a gluten agglomerate. Finally biological active wheat gluten is sepd. and recovered from the agglomerate.

Gluten, starch, bran and germ material are recovered in good yields and quality, with min. damage to the physical, chemical and biological properties of the grain constituents. 9.9.77 as 23.3.78. (38pp200)

SODE- ★ D13 22304B/12 ★DT 2837-294

Food prods contg. bran, gluten and flour - prepd. continuously by extruding mixt. with water; used in diet bread, cereals, etc.

SODES SA 09.08.78-FR-024066 (29.08.77-FR-026782)

(D11) (15.03.79) A21d-13/06 A23l-01/30

Food prod. is prepd. from a mixt. contg., by wt., 20-80% bran, 5-20% gluten, balance, to 100%, flour or starch. After adding 5-20wt.% water, the mixt. is cooked and extruded.

Process comprises (a) continuously charging the mixt. to the first part of an extruder cylinder, esp. contg. 2 screws; (b) adding the water; (c) pre-heating to 80-120°C in 2nd part of cylinder and compressing; (d) heating to 130-220°C and mixing and (e) extruding.

Compsns. can be used for the prepn. of special, e.g. diet breads, sugared or salted biscuits, breakfast foods, cereals, porridge-type flours and soup bases. The prods. have a low calorie content and prevent constipation. 26.8.78 as 837294. (16pp200)

Treating fish to produce auto-immune response - for impairing gonad system so that fish farming harvest can be controlled by feeding
THOMAS F G 05.09.78-GB-035704 (06.09.77-GB-037168)
C03 P14 (21.03.79) A01k-61

Fish are treated by inducing the presence of antibodies against gonad tissue in them, so as to produce an auto-immune response that impairs the development and/or maintenance of a normal gonad system in the fish.

Treated fish do not become sexually mature, so that the need to harvest fish imposed by sexual maturity (skin diseases etc.) is removed, and their growth to a suitable size can be controlled by feeding. Then in fish farming operations fish may be obtd. at times when wild fish are not available. Expensive pigmented food does not have to be fed to a whole group of salmon in sea water in case of early maturity, but it can be fed just before harvesting. With Pacific salmon now being considered for farming in the UK the sterilisation would ensure that in the event of an escape of such a male salmon, there would be no long term problem with Atlantic salmon. 5.9.78 as 035704 (7pp1248)

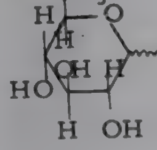
2,5-Di:methyl-4-hydroxy-2,3,-di:hydrofuran-3-one prepn. - by reacting 6-deoxy-glucose with organic nitrogen base and organic carboxylic acid

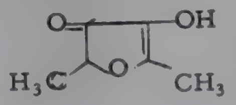
HASEGAWA KK 14.07.77-JA-083507

E13 (15.02.79) C07d-307/60

2,5-Dimethyl-4-hydroxy-2,3-dihydrofuran-3-one of formula (I), having a strawberry-like flavour, is prepd. by reacting 6-deoxy-glucose of formula (II) with an organic nitrogen base (e.g. methylamine, isopropylamine, sec-butylamine, dimethylamine, morpholine, trimethylamine, pyridine, etc.) and an organic carboxylic acid (e.g. formic acid, acetic acid, capronic acid, malonic acid, etc.).



(II)



(I)

(II) is easily prepared at low cost for glucose which is cheap and easily available. Prim. and tert. amines can be used as well as pyridine, and a wide range of organic carboxylic acids, including aromatic carboxylic acids, can be used in addn. to acetic acid.

Pref. the reaction is carried out in a polar solvent, e.g water, dimethyl sulphoxide, methanol, etc., and at 50-150°C; and the organic nitrogen base and organic carboxylic acid are both used in an amt. of 0.2-50, pref. 0.5-20 mol. per mol of (I). 14.7.77 as 083507 (5pp140)

JAOR ★ D13 22953B/12 ★J5 4020-000

Purificn. of stevioside from its aq. extract - by adding slaked lime, carbon di:oxide and phosphoric acid to produce solids to absorb impurities

JAPAN ORGANO KK 18.07.77-JA-085092

B03 E13 (15.02.79) A23l-01/22 C07a-03

Purification of stevioside comprises mixing its aq. extrac with 20-100 wt.% of slaked lime based on the solid matter contained in the extract followed by blowing CO_2 gas into the mixture to adjust to a pH of 10.5-12.5, extracting the mixture, mixing the first extract with phosphoric acid foll owed by extracting, and then subjecting the second extract to further purification treatments.

By blowing CO_2, the filtration resistance is reduced when compared with the conventional treatment using slak ed lime. The calcium ion remaining in the first extract reacts with phosphoric acid to form ppte of calcium phosphate, on which impurities are adsorbed. Hence, purific tion efficiency obtd. in the subsequent treatments using a ion-exchange resin and a synthetic adsorbent is greatly increased. 18.7.77 as 085092 (4pp140)

ASAE ★ D13 22961B/12 ★ J5 4020-010
Foamable water-in-oil compsn. for butter cream prodn. - contains stevioside sweetener, aq. saccharide soln. and plant or animal oil phase contg. an emulsifier
ASAHI ELECTROCHEM IND KK 15.07.77-JA-084884
(15.02.79) A23d-05 A23l-01/19 B01f-03/08

The compsn. comprises 0.05-1% of stevioside as sweetening, 20-40% of an aq. phase contg. monosaccharide and/or disaccharide, e.g. glucose, fructose, sucrose, etc. in an amt. of 10-30% as to adjust the viscosity of the aq. phase at 20-150 c.p., and 80-60% of an oil layer, e.g. rice bran oil, soybean oil, cotton seed oil, corn oil, peanut oil, coconut oil, butter, lard, beef tallow, fishes oil and whale oil, etc., contg. an emulsifier, e.g. glycerin fatty acid ester, sorbitan fatty acid ester, propylene glycol fatty acid ester and sucrose fatty acid ester, etc.

The compsn. exhibits excellent whipping property and sweetness, and is suitable for use in the prodn. of butter cream, and exhibits excellent over run (150-250) even in such case that sweeting is previously contained and excellent shape-keeping property as butter cream. 15.7.77 as 084884 (4pp34)

Muscardine control in silkworms - by feeding with mulberry leaves sprayed with soln. of a bis-di:thiocarbamate and a benzyl ammonium chloride cpd.
MIKASA KAGAKU KOGYO KK 15.07.77-JA-085461
C03 (15.02.79) A23k-01/16 A61k-31/32

Method comprises feeding the silkworms with Japanese mulberry leaves sprayed with a soln. contg. 100-400 ppm of diammonium ethylenebis(dithiocarbamate) (A) and 50-200 ppm of dimethylalkylbenzyl ammonium chloride (B). (A) and (B) act. synergistically.

Typical compsn. comprises 12.5% of (B), 25% of (A), 5% of ethanol, 12.0% surface active agent and 46.5% of water. 15.7.77 as 085461 (3pp108)

MITU ★ D13 23037B/12 ★ J5 4020-141
Preventing gastroentropathy in domestic animals - by applying compsn. contg. magnesium salt and calcium phosphate
MITSUBISHI CHEM IND KK 11.07.77-JA-082817
B05 C03 (15.02.79) A23k-01/17 A61k-33/42

Gastroentropathy of domestic animals is prevented by admin. of Mg salt (I) and Ca phosphate (II). Pref. (II) is applied in amt. of 0.2-15% per 1 g Mg in (I). (II) is esp. Ca sec.-II or tert. phosphate. (I) is esp. Mg CO_3. 11.7.77 as 082817 (3pp69)

YOSH/ ★ D13 23040B/12 ★ J5 4020-149
Preserving perishable, oxidisable materials - using cobalt-salicyl:aldehyde-ethylene:di:imine as oxygen adsorbent
YOSHIKAWA T 15.07.77-JA-084792
E12 Q75 (E36) (15.02.79) A23l-03/34 F25d-23

The method is effected by (a) using Co-salicyl-aldehyde-ethylene-di-imine (abbr. COSAEDI), its deriv. or similar available as the adsorbent for oxygen, (b) preserving perishables, oxidisables, moderately breathing substances, etc., in air tight vessel, (c) installing the vessel including the adsorbent in the path between the air tight vessel and atmosphere, and (d) decreasing the oxygen content in the air tight vessel.

The atmos. of the vessel can be kept under low oxygen content and perishables, oxidisables, moderately breathing substances, etc. which are easily deteriorated by oxygen, can be preserved safely. 15.7.77 as 084792 (4pp5)

KAWA/ ★ D13 23041B/12 ★ J5 4020-152
reatment of foods contg. beta-form rice starch - by impregnating in cid or alkali and heat treating to prevent beta-lysing
KAWAHARA T 14.07.77-JA-084890
(15.02.79) A23l-01/10

oods are prepared by impregnating an aq. soln. of acidic r alkaline substance in a material contg. β-form rice tarch and heat-treating it at >120°C for a short time. he aq. soln. may be of citric acid, tartaric acid, malic cid, lactic acid, their salt, etc. or Na_2CO_3, $KHCO_3$, $aHCO_3$, $(NH_4)_2CO_3$, etc.

The β-lysation of α-lysed starch from e.g. nonglutinous ice, glutinous rice, rice powder, glutinous rice powder, rtificial rice prepared from raw rice powder, etc. can be prevented, thus preventing reduction in taste and flavour, digiestability, etc. The β-form starch in above materials can be α-lysed by boiling, steaming, etc. and the α-lysed starch is likely β-lysed in a short time. Thus hitherto various preventive methods have been proposed, but all of them have been unsatisfactory. The inventor has found that the food obtained by impregnating acidic or alkaline material in rice, starchy material, etc. and heat-treating it above 120°C, is hardly β-lysed even preserving it at normal temperature and is hardly deteriorated in taste and flavour.

The impregnation is practiced at room temperature for 0.5-1 hour or at 90°C for 10 minutes. If necessary prior to the heat-treatment the starchy material may be washed with water to remove acid or alkali remained in it. 14.7.77 as 084890 (3pp5)

HAYA- ★ D13 23042B/12 ★ J5 4020-158
Orange flesh treatment - by removing endocarp chemically with acid and alkali and treating with water contg. e.g. citric or malic acid
HAYASHIKANE KANZUME 18.07.77-JA-084987
(15.02.79) A23b-07 A23l-01/21

The endocarp of an orange is removed by treating orange chemically with acid and alkali and treating with water. Method is characterised by using water contg. some organic acid for the water-treatment. As organic acid, citric acid, malic acid, etc. is applied and usually aq. 0.1-1% citric acid soln. is applied.

The amt. of water required for the water-treatment can be saved to ca. 1/50. The time required for the water-treatment can also be decreased to ca. 1/3, i.e. 30 minutes by conventional method can be shortened to 8-10 minutes. As the result the loss of sugar caused from dissolving out in water from orange flesh can be decreased and the sugar applied for canned orange can also be saved. 18.7.77 as 084987 (4pp5)

YOSH/ ★ D13 23043B/12 ★ J5 4020-159
Deodorising garlic - by mixing the powder with magnesium hydroxide and opt. magnesium oxide
YOSHIKAWA Y 13.07.77-JA-084356
E33 (15.02.79) A23l-01/34

The method comprises combining powdery magnesium hydroxide and opt. a little magnesium oxide in garlic powder. The amt. of powdery magnesium hydroxide is equal or exceeds the amt. of garlic powder. Magnesium hydroxide can not only adsorb the odorous substance in garlic, but also shows medicinal effect on pyrosis and laxative effect on the constipation caused by garlic. The deodourising effect is increased by the addn. of magnesium oxide.

Magnesium hydroxide can be easily obtd. as natural brucite or by reacting lime milk with sea water or brine. It shows little solubility and can keep solid form even under moisture content 50-60%. The magnesium hydroxide and garlic powder mixt. can be solidified and the volatile oily component of aricine which causes the unpleasant odour, can be adsorbed and sealed in magnesium hydroxide. The effect can be further improved by combining a small amt. of magnesium oxide and water in garlic powder and magnesium oxide are reacted to form magnesium hydroxide. Thus aricine can be better sealed in magnesium hydroxide. 13.7.77 as 084356 (4pp5)

Frozen heat-coagulated egg white prodn. - by adding dextrin alcohol to heat-coagulated egg white and freezing mixt.
Q.P. CORP 11.07.77-JA-083154
(15.02.79) A23l-01/32

Frozen heat-coagulated egg white (I) is prepd. by adding 10-20 pts. wt. of dextrin alcohol to 100 pts. wt. of heat-coagulated egg white and freezing the mixt. Pref. dextrin alcohol of average polymerisation degree [illegible] 11 is used. The frozen heat-coagulated egg white may be prepd. by heat-coagulating the mixt. of egg white and dextrin alcohol and freezing the mixt. Freezing is pref. at $<$ -18°C for $\geq$ 2 weeks.

(I) can be combined in amts. 5-700 pts. wt. per 100 pts. wt. minced fish meat to increase the jelly strength of marine pasty food and to partly substitute minced fish meat with inexpensive egg white. 11. 7. 77 as 083154 (4pp5)

NISW ★ D13 23046B/12 ★J5 4020-167
Frozen minced fish meat prepn. - by mixing soybean protein with aq. alcohol, mixing with fish meat and freezing mixt.
NISSHIN OIL MILLS KK 15.07.77-JA-084198
(D12) (15.02.79) A23l-01/32

Method comprises treating soy bean protein with hydrous alcohol, mixing it with minched fish meat and freezing the mixt. Pref. soy bean protein is treated with aq. alcohol (e.g. methanol, ethanol, propanol, butanol, etc.) of alcohol content $>$ 50 wt.% at 15-60°C for $>$5 mins. The standard of the degree of the alcohol-treatment is that NSI (soluble nitrogen indicator) of soy bean protein is decreased to $<$30. The treated soy bean protein is pref. combined in minced fish meat 10-40 wt.% esp. 20-30 wt.%.

Freeze-denaturation of soy bean protein is prevented by first treating is with aq. alcohol. The treated soy bean protein is mixed with minced fish meat prior to freezing and the conventional defrosting mixing process is simplified. By combining the soy bean protein with the fish meat the dehydration of the minced fish meat is simplified and the loss of fish meat by dehydration is decreased. 15. 7. 77 as 084194 (5pp5)

CALP- ★ D13 23047B/12 ★J5 4020-169
Yogurt prodn. - by heat-treating acidic milk while suppressing vibration
CALPIS SHOKUHIN KOG 15.07.77-JA-084285
(15.02.79) A23c-09/12

Method comprises preparing an acidic milk of pH 5.2-5.9 and non-fat milk solid content 6-15% and heat-treating it at 50-90°C while suppressing the vibration as much as possible.

Pref. the acidic milk is milk made acidic with an organic acid or fruit juice or a mixt. of milk and fermented milk having pH 3.0-4.0 and sugar content of brix 30-60. Fermented milk can be prepd. by inoculating lactic acid bacteria showing strong acid-producing ability, such as Lactobacillus vulgaricus, into skimmed milk, fermenting until the pH of the skimmed milk falls to 3.0-4.0, homogenising and adding sugar to brix. 30-60.

Prods. having a smooth texture and a refreshing sour taste can be easily prepd. without using additives. 15. 7. 77 as 084285 (4pp5)

ROKK- ★ D13 23048B/12 ★J5 4020-173
Curry powder with excellent light resistance - prepd. using safflower yellow as colourant
ROKKO BUTTER KK 14.07.77-JA-084675
E24 (15.02.79) A23c-19/12 A23l-01/27

The method is characterized by using natural yellow pigment, safflower yellow ($C_{21}H_{22}O_{11}$) as the colourant in preparing curry powder instead of turmeric.

The colorant safflower yellow has excellent light resistance and the foods prepd. with the curry powder hardly fades even on exposure to light. Thus they can be packaged in transparent packaging material and the cost of packaging material can be reduced. Safflower yellow also has excellent, salt resistance and microbial resistance. Thus turmeric can be wholly replaced with safflower yellow and usually safflower yellow is combined at 30 w/w% in the objective curry powder. 14. 7. 77 as 084675 (3pp5)

Feedstuff prodn. for livestock, fish, etc. - by cooling or freezing waste sea food e.g. tuna, crushing, and defatting and dehydrating using organic solvent
NIPPON PAINT KK 12.07.77-JA-083674
C03 (16.02.79) A23k-01/10

Wasted marine prods. are cooled or frozen, crushed to give a fine powder, subjected to defatting and dehydration using an organic solvent under cooling to deodorise the powder and then dried. Crushing is conducted to give a fi fine powder having 10 to 50 mesh size. The organic solvent includes n-hexane, ethyl ether, ethyl acetate, toluene, acetone, etc. Drying is at 40-60°C.

The feedstuffs contain 8 wt.% water, 2 wt.% fibrous material, 65 wt.% protein, 18 wt.% ash and 6 wt.% fat.

In an example, waste prod. of tuna is rapidly cooled to -2 to -4°C using liq. N_2 and crushed to 10 to 250 mesh powder under cooling to the above temp. The resultant is contacted with acetone overnight and the solid material is recovered by filtration. The solid is then dried at 70°C to give powder prod. 12. 7. 77 as 083674 (4pp22)

In a batchwise treatment for concentrating fruit juice or coffee extract by freezing and recovering mother liquor formed. (a) a bathc of the liquid is confined at rest within long, narrow tubes having dimensions so that max. conductive distance is 5-25 mm. of a static heat exchanger.

Then (b) heat is withdrawn from the batch to crystallise part of the water creating a coherent matric of ice crystals with mother liquor trapped between the crystals. and (c) the matrix of crystals is released from the tubes to which it is attached by briefly externally heating the tubes so that the matrix including the mother liquor is expelled downwardly out of the heat exchanger.

Next (d) the material expelled in step (c) is broken up by a disc at the lower extremity of the tubes to produce material of a desired size, to permit sepn. of the broken up material and leaving a portion of the matrix held within the tubes by the disc to plug the lower end of the tubes. Finally (e) the crystals in the mass obtained in step (d) are transferred to a wash column to allow sepn. of the crystals from the mother liquor and mother liquor recovery, and (f) the tubes are refilled with additional liquid. 12.5.77 as 796388 (+ 5.12.75 - US - 637933) (10pp990).

Sepg. a corn starch milk into protein and starch - using multistage sepn. and washing using hydrocyclones
CPC INTERNATIONAL INC 22.10.76-US-734683
*+P41 (D17) (13.03.79) *BE-859-954 C13l-01 +C13l-03*

The mill starchfraction in a corn wet milling process is divided into a protein-rich portion and a starch-rich portion by passing the fraction through a pair of separation zones arranged in series. Each sepn. zone comprises a series of hydrocyclones only and the protein rich component is drawn from the first zone and the starch rich component from the second zone. A pressure difference of at least 100 p.s.i. is maintained across each hydrocyclone in the first zone, and at least 80 p.s.i. in the second zone.

Each hydrocyclone discharges a protein-rich stream through a vortex member and a starch enriched stream through an apex member. The starch enriched stream from the first of the hydrocyclones in the first zone is fed to the second zone whilst the starch enriched stream from the second of the hydrocyclones in the first zone is fed back into the mill starch fraction. The protein enriched streams from the hydrocyclones of the second zone are also fed back into the mill starch fraction. 22.10.76 as 734683 (12pp525).

Multistage screw press to expel liq. from oil seed etc. - improves extn. by fragmenting pressed material at end of each stage
KRUPP F GMBH 19.11.77-DT-751703
P71 (D23) (01.03.79) A23n B30b

The press has several successive stages, of compression, each followed by a zone of pressure relaxation. In each of the stages pressure is first increased progressively and then relaxed down to ambient pressure. At least part of the material becomes fragmented into small pieces which become redistributed before recompression in the next stage.

The average level of compression pref. increases from one stage to the next. The several stages are pref. provided by several lengths of helical screw spaced in succession along a common axis. At the discharge end of each screw length, the casing has a throat section which allows pressure to drop to ambient.

Fragmentation of the material between stages allows redistribution of particles and better drainage under subsequent recompression. An axially shorter press is suitable for a given output. 14. 11. 78 as 871990 (11pp448)

Centrifugal vortex separator - has split flanged inserts compressed to form helical channel
MOSCOW MEAT DAIRY INST 17.10.75-SU-181679
J01 P41 (18.04.78) B04b-01/04

Simplified design, of a vortex centrifuge separator for milk or other inds. is ensured by inserts featuring flanges at the edge with a bearing surface. The inserts are assembled with cutouts in the same longitudinal plane, while the ends of the set of inserts are compressed by projections. The height of the latter is a multiple of the flange height, and the bearing surfaces are staggered and set on different sides of the cutout plane.

The emulsion is fed beneath the inserts holder from where it flows into the helical channel for sepn. by centrifugal forces. The heavy fraction leaves from the lower surface of the inserts and moves towards the flanges, while the light fraction follows the inner surface of the inserts. The separated phases move at right angles to the general flow of emulsion around the rotor axis.

Domestic appliance for food dehydration or dough raising - comprising cabinet with heaters and fan to control air flow
KUEST J 11.08.77-US-823875
(13.03.79) A23c-03/02

A single appts., used either for food dehydration or dough raising includes a cabinet with a front door which is mounted to provide exhaust vents. The rear wall of the cabinet has air intake ports. Shelves arranged in pairs on the side walls support drying racks between which are formed air passageways. A dough raising shelf may be supported on the shelves.

When used for raising dough the relative humidity of the cabinet may be increased. A constant speed blower motor and fan are mounted on the rear wall for continuously drawing replacement air from the intake ports to exit through the vents. A screen is placed in front of the fan to diffuse the air uniformly throughout the air passageways. The air flow is stopped when used for raising dough. Heaters in the cabinet are used to control the temp within the cabinet to 100 - 160°F for dehydration and to 75 - 100°F for dough raising.

The ventilation flow design minimises cross food flavouring and permits the simultaneous dehydration of diff.-

erent foods. 11.8.77 as 823875 (6pp295).

Sewage sludge treatment - with activated sludge contg pptd phosphate particles
UNION CARBIDE CORP (BIO -) 11.03.71-US-123309 (02.05.72-DT-221498)
*(15.03.79) *US3681-235 C02c-01/06*

Crude waste water is purified by treatment with activated sludge followed by aeration to reduce B.O.D. and to promote uptake of phosphate by the microorganisms present. Sludge enriched with phosphate is separated from liquid poor in phosphate, which is discharged. The phosphate enriched sludge is lead to a phosphate sepg. zone where an agent, e.g. chalk is added to ppte water soluble phosphates. The sludge still contg. the pptd. phosphate is recycled.

Process simplifies the appts. required and improves capacity. 2.5.72. as 221498 (4pp068)

DHVR- D15 64261U/43 =DS 2316-483
Chemical water treatment - in fluidized bedof grafting material with sodium hydroxide s olution injection
DHV RAADGEVEND INGE 04.04.72-NL-004477
*(15.03.79) *DT2316-483 C02b-01/22*

In a new method for the chemical softening of water, a fluidised bed is produced in the granular grafting material contained in a reactor by an ascending stream of water and of a softening agent. Water and softening agent are sprayed separately from each other, pref. at an angle of 90° to the generally ascending flow. An alkali metal hydroxide soln. such as NaOH is sprayed in radial planes at a level above the water spray nozzles.

This saves the sepn. of any solids such as slurry when milk of lime is used and simplifies the process. 3.4.73. as 316483 (5pp39)

ASEN- D15 30859W/19 =DS 2352-917
Sewage aeration basin - with circulating flow induced by pump and air injector through perforated pipe
ASENDORF-ABWASSER-A 22.10.73-DT-352917
*(15.03.79) *DT2352-917 C02c-01/12*

A high duty aeration basin for the activated sludge treatment of sewage uses an injector to circulate a mixt. of water, sludge and air. The injector is followed by a pipe around the basin bottom which has a length of at least one-third of the periphery in circular or three-quarter of the length in rectangular basins. Holes distributed over the top of the pipe have a dia. of 5-25 mm.

This combines the prodn. of a very intensive air bubble/sludge mixt. with a minimum of energy consumption. 22.10.73. as 352917 (7pp39)

DAMB- D15 04385A/03 =DS 2629-603
Canal cleaning grate - has rake performing compound motion on multi-unit framework (NL 3.1.78)
DAMBACH-INDUSTRIEAN 01.07.76-DT-629603
*Q42 (15.03.79) *DT2629-603 E02b-05/08*

A bar screen cleaning device with a rake for use in sewage channels is mounted on a guide frame on which a moving frame can slide up and down, actuated by a hydraulic cylinder. The rake is attached to a crossbar which can slide on the moving frame by the action of two ropes slung over two pulleys.

This doubles the stroke of the hydraulic cylinder for the rake; the whole rake can be arranged outside the channel when not in use. 1.7.76. as 629603 (7pp39)

Coke oven gas waste water desulphurisation - by combustion with air and forming waste gas having high hydrogen sulphide to sulphur di:oxide ratio
KRUPP-KOPPERS GMBH 15.12.77-DT-755830 (00.00.73-DT-361910)
H09 (15.03.79) C02c-05

In parent patent, waste waters, obtd. in coke oven gas desulphurisation with an organic O carrier-contg. scrubbing soln., are removed by pyrolytic decomposition using the heat of the evaporating liqs. and of the waste gas formed. The inorganic components of the waste waters, conc. to 70-30% are decomposed in a reducing atmos. generated by the combustion of coke oven gas and of NH_3 vapours formed in coke oven gas treatment in absence of air. S formed is sepd. Waste gas and vapours formed in waste water concn. are added to coke oven gas before pre-cooling. In this addn., waste water decompsn. takes place in a combustion chamber at 1000-1100 (1050)° C. Air quantity added is such that waste gas formed in combustion chamber exhibits mol. ratio $H_2S:SO_2>2:1$ (2.1:1 to 2.6:1).

Waste gas formed is free from N oxides. Air supply control to combustion chamber achieves optimum $H_2S:SO_2$ ratio for S deposition, according to equation $4\ H_2S + 2SO_2 \rightarrow 4\ H_2O + 3\ S_2$. 15.12.77. as 755830 Add to 2361910 (5pp200)

VOLL- ★ D15 22185B/12 ★DT 2739-126
Storm sewage tank emptying system - with fixed displacement pump controlled by high and low water level
FA VOLLMAR O 31.08.77-DT-739126
(15.03.79) C02c-01

A tank for the temporary storage of storm sewage is equipped with a pump which runs always at full capacity when switched ON and feeds the water into the channel upstream of a gate valve. It is switched on and off by a sensor in the channel which responds to an abnormally high water level, and by a sensor which responds to the empty state of the storm sewage tank.

placement pumps and empties the storm sewage tank quickly without risk of overloading the biological and mechanical clarification plant. 31.8.77 as 739126. (22pp39)

DEBB/ ★ D15 22211B/12 ★DT 2739-737
Sewage sludge feeder - with scraper chain conveyor at bottom of storage tank
DEBBELER B 03.09.77-DT-739737
Q35 (15.03.79) B65g-65/42

Sewage sludge must be freed from the bulk of its moisture content before it can be mixed with quicklime to convert it to a solid consistency suitable for dumping or for fertiliser. When this has been done by pressurised endless belt screens, the sludge does not flow freely and a scraper conveyor is used at the bottom of the storage tank to move it to the distributor conveyor.

Such a conveyor loosens the solid sludge. It is simple in design and functions reliably even when agressive media have to be handled. 3.9.77 as 739737. (7pp39)

Industrial waste disposal - by evaporation of film on revolving heated horizontal drum
BOSCH R GMBH 06.09.77-DT-740031
(15.03.79) C02c-05

Disposal of effluents with anorganic or organic contaminants or dispersions is based of evapn. The effluent forms a film on the surface of a revolving heated cylinder so that the more readily volatile phase evaporates. The incrustation of residual substance is removed mechanically from the cylinder surface.

Provides a simple and economical method for the disposal of industrial waste, even in large quantities. The dispersing agent can be recovered and the plant has low overall height requirements. 6.9.77 as 740031. (11pp39)

KEEF/ ★ D15 22441B/12 ★FR 2394-319
Reverse osmosis via selective membrane subjected to liq. pressure - recuperates energy by using discharged concentrate to drive turbine wheel
KEEFER B G 15.06.77-US-806704
J01 +Q56 (16.02.79) B01d-13/04 F04b-37/02 F04d-01

A machine and a process in which reverse osmosis via selective membranes is used to separate a feed fluid into a permeate and a concentrate. The system is of the type comprising a first rotor which pumps feed fluid into a second rotor in the form of a pressure vessel contg. the membranes. The concentrate discharged from the second rotor is used in part at least to provide recuperated energy.

The second rotor is fitted coaxially around the first rotor. The second rotor has concentrate outlet nozzles directing the fluid on to impeller blades or a turbine wheel mounted on the shaft of the first rotor. The two rotors are turned at different speeds by a common drive to which the turbine wheel returns recuperated energy. Pref. the first rotor turns in the same direction as but at a higher speed than the first.

Used partic. in the prodn. of drinking water by desalination of sea water, the purificn. of waste waters and dewatering food prods. Power saving by recuperation of energy from discharged concentrate. Reduced pressure on membranes gives them extended life. Relative rotation of toros prevents membranes blocking. Common axis for both rotors simplifies construction. Friction losses reduced by 80% by halving relative speed difference between rotors. 14.6.78 as 017784 (54pp448)

UGIN ★ D15 22457B/12 ★FR 2394-602
Biodegradable cleaning compsn. for hydrocarbon spillages - contg. mixt. of specified mono and di-phosphoric acid ester(s)
UGINE KUHLMANN 25.03.77-FR-008938
A97 E11 H03 (A25 D25) (16.02.79) B01f-17/14 C02b-09/02 C11d-01/34

The compsn. comprises a 35%/65% mol. ratio mixts. of esters of formula R-O(A)-P(O)(OB)(OB) and $[R\text{-}O(A)]_2$=P(O)(OB). In the formulae R is a 6-20C residue of an alcohol or acid; A is either a mixt. of ethoxy and propoxy groups, the ethoxy/propoxy ratio being < 2 and the number of propoxy groups being <10; or A is 1-4 ethoxy groups when R is below 12C, 1-5 ethoxy groups when R is below 16C or 1-6 ethoxy groups when R is over 16C; B is H, an alkali(ne earth) metal, an amine contg. 6-20C or organic cpds. with a high N and low C content. The mol. ratio of each ester type in the mixture is 35-65%.

Compsn. is used for cleaning hydrocarbon spillages on the ground or water. The cpds. have a high biodegradability and form with water a medium enhancing the biodegradation of hydrocarbons. 25.3.77 as 008938 (16pp597)

ZANU ★ D15 22471B/12 ★FR 2394-968
Isolation of washing machine water supplies from contamination - by preventing reverse diffusion of water softener regeneration salts
ZANUSSI INDUSTRIE SPA 16.06.77-IT-045721
F07 P28 (16.02.79) A47l-15/42 D06f-39/08

The water supply for a washing machine is connected with a water softener unit or a salt regeneration reservoir via a three-way cock or via an open branch discharging above an overflow tank. The open branch vents the supply line to prevent any suck-back into the supply if the supply pressure is low. Pref. the overflow head is variable, e.g. by rotation of a cranked outlet.

The valve prevents leaching of the salt stock into the supply leg. 15.6.78 as U17890 (8pp515) (w)

Reduction of nitrogen oxide to nitrogen in waste gas - by treatment with ammonia and a catalyst obtained by electrolysing waste water, contg. heavy metals, with an iron anode

MITSUBISHI PETROCH KK 13.07.77-JA-083003

E36 J01 (J03) (14.02.79) B01d-53/34 B01d-107 B01j-23/74

In reacting a gas contg. nitrogen oxide with ammonia in the presence of a catalyst to reduce nitrogen oxide to nitrogen, the catalyst is obtained by electrolyzing waste water contg. heavy metals with an iron anode during introduction of air to oxidize it, precipitating the heavy metals as spinel type ferrite from the waste water to by-produce a sludge contg. the spinal type ferrite, the ferrite containing iron and at least one kind of heavy metals, and calcining the sludge at 300-600°C. The catalyst consists of iron and at least one kind of Co, Ni, Cr, Zn or Mn.

Waste water contg. 5.73 g/2l of $Na_2Cr_2O_7.2H_2O$ was electrolyzed with iron electrodes at 10v and 2A to dissolve 12g/2l of Fe^{2+} from the electrodes. The electrolyzed waste water was stirred at 40°C for 30 minutes to precipitate a ferrite contg. sludge. The sludge was filtered out, shaped, dried at 100°C for 2 hours, and calcined at 200°C to obtain the catalyst. 13.3.77 as 083003 (6pp)

Anaerobic fermentation of calcium-contg. waste water - by blowin carbonic acid gas into the sludge from the fermenter to preven bacteria deactivation

SHOWA DENKO KK 14.07.77-JA-083574

(14.02.79) C02c-01/14 C12b-01

An anaerobic fermentation treatment method of calcium-containing waste water was developed.

Waste water is subjected to anaerobic fermentation in a fermenter where organics are decomposed into methan gas and carbonic acid gas by means of methane bacteria; the sludge-contg. waste water is then sent to a sedimentation basin for sepn. of sludge; and the sludge is mostly sent back to the fermenter. Carbonic acid gas is blown into the sludge from the outlet of the fermenter.

This method prevents the deactivation of methane bacteria due to the accumulation of calcium carbonate in the system, as the addn. of excess carbonic acid gas results in the conversion of the calcium carbonate into soluble calcium bicarbonate which is easy removed in soln. The, method is used for various saponification waste water, and other calcium-contg. waste waters, e.g. those from the Wacker process, etc. 14.7.77 as 083574 (2pp117)

EBAI ★ D15 22863B/12 ★J5 4019-551

Biological denitrification of human waste - by adding phosphorus cpd. and magnesium cpd. and sepg. obtd. ppte. using high polymer coagulant before denitrification of liq.

EBARA INFILCO KK 13.07.77-JA-083988

(14.02.79) C02c-01/02

A phosphorus ion-dissociable cpd. e.g. sodium phosphate, and a magnesium ion-dissociable cpd., e.g. magnesium hydroxide, are added to part of the waste water to be treated, the obtd. ppte is subjected to a solid-liquid sepn. using a high polymer coagulant, and the sepd. liquid is introduced to the biological denitrification treatment process following digestion.

This method, using part of the waste water as organic carbon source for denitrifying bacteria after removing ammonia as an ammonium magnesium phosphate ppte., not only obviates the need for valuable materials, e.g. methanol, but also recovers ammonia nitrogen and phosphoric acid present in the waste water as ammonium magnesium phosphate which is useful as a fertiliser. 13.7.77 as 083988 (3pp117)

HACH- ★ D15 22864B/12 ★J5 4019-552

Biological denitrification of human waste, etc. - using nitrifying bacteria, denitrifying bacteria and two/stage sedimentation

HACHIYA KOGYO KK (HITK) 15.07.77-JA-084220

(14.02.79) C02c-01/02

Waste water is introduced into a digestion tank to oxidise the ammoniacal nitrogen into nitrite or nitrate with nitrifying bacteria, into a denitrification tank contg. denitrifying bacteria, and lastly into a sedimentation tank to separate conc. activated sludge from denitrified liquor. The ammoniacal nitrogen-contg. waste water is separately introduced into the digestion tank and the denitrification tank, and the floating sludge in the spare sedimentation tank between the denitrification tank and the sedimentation tank is fed, with the denitrified liquor, back to the digestion tank.

The method ensures the enhancement of sludge sepn. efficiency, the exact removal of floating sludge, and the prevention of discharge of SS components. 15.7.77 as 084220 (3pp117)

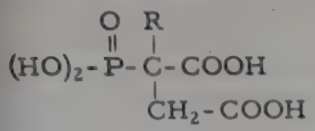
Scale removal from metal, e.g. boiler evapn., tubes - using sol contg. phosphono carboxylic acid

KORYU KOGYO KK 16.07.77-JA-085312

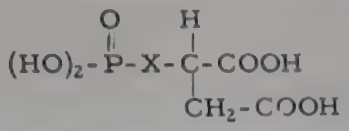
E11 M12 (16.02.79) C02b-05/06 C23f-14/02

Scale is removed by dissolving in a soln. contg. a phosphono carboxylic acid of formula (I) or (II),



(I)

$$(HO)_2\text{-}\overset{\overset{\displaystyle O}{\|}}{P}\text{-}\underset{\displaystyle CH_2\text{-}COOH}{\overset{\displaystyle R}{C}}\text{-}COOH \quad (I)$$



(II)

$$(HO)_2\text{-}\overset{\overset{\displaystyle O}{\|}}{P}\text{-}X\text{-}\underset{\displaystyle CH_2\text{-}COOH}{\overset{\displaystyle H}{C}}\text{-}COOH \quad (II)$$

In the formulae, R is H, ≤4C alkyl, alkenyl, alkynyl or allyl, cycloalkyl or aralkyl or $-CHR^1-CHR^2R^3$. R^1 is H, ≤ 4C alkyl or carboxyl. R^2 is H or CH_3. R^3 is carboxyl. X is $-CH(COOH)-CH_2-$, $-C(Y)(COOH)-$ or $-C(Y)(PO_3H)-$. Y is H or CH_3.

The soln. is effective over a wide temp. range. Typical acids are 1-phosphono propane-2,3-dicarboxylic acid, 1,1-diphosphono propane-2,3-dicarboxylic acid and 2-phosphono butane-1,2-dicarboxylic acid. The salt is pref. an alkali metal salt, ammonium salt or amine salt. The conc. of the acid or salt in the soln. is pref. 0.5-50 wt.%, usually 1-5 wt.%. 16.7.77 as 085312 (3pp42)

NIDE ★ D15 23162B/12 ★J5 4021-051

Heavy metal sepn. from waste water - by adding ferrous salt which is oxidised to form heavy metal-contg. magnetic particles, which can be removed

NIPPON ELECTRIC KK 15.07.77-JA-085345

(16.02.79) C02c-05/02

Waste water contg. < 2000 ppm heavy metal and recycled magnetic particles is added with a ferrous salt in an amt. of 2-100 times the total moles of heavy metal, adjusted to pH 9-12 by the addn. of an alkali, and the ferrous salt is oxidised gradually to form strongly magnetic particles including heavy metal without heating by supplying oxygen at a rate of 600 ml per min. per mole of ferrous salt, without exceeding the amt. of oxygen necessary to oxidise the ferrous salt.

The method creates strongly magnetic particles, contg. heavy metals, which are very hard to redissolve in water, and are applicable as material for wave absorbers or magnetic fluids. 15.7.77 as 085345 (6pp117)

ASAG ★ D15 23163B/12 ★J5 4021-052

Treating waste water contg. nitrogenous cpds. and oxidisable organics - by contacting with microorganism-fixing porous material

ASAHI GLASS KK 19.07.77-JA-085574

(16.02.79) C02c-01/02

Removal of nitrogeneous cpds. and oxidisable organics, partic. NH_3, COD, and BOD components, present in waste water is claimed. Water to be treated is contacted with microorganisms-fixing porous material, e.g. calcined attapulgite, having an apparent specific gravity of 0.5-2.0 an average grain size of 0.1-3.0 mm, and an average bore diameter of 0.008-1 μ in a fluidised or stationary bed.

Process is applicable to the treatment of general refuse, sanitary sewage, general sewage, fish processing waste water, poultry farm waste water, chemical factories, foundry waste gas-treated waste water, etc. contg. ammonia, ammonium salts, urea, amines, nitrites, etc. 19.7.77 as 085574 (5pp117)

HITF ★ D15 23164B/12 ★J5 4021-054

Biological denitrification of organic waste water - utilising carbon di:oxide given off during reaction as carbon source for microorganisms

HITACHI SHIPBLD ENGG KK 18.07.77-JA-086338

(16.02.79) C02c-01/02

Waste water contg. nitrogenous cpds. is supplied through the top of a reactor provided with microorganisms-adhered fillers, e.g. plastics, gravel, sand, or 10-30 mm fibre-brush plate etc. arranged axially 10-20 mm apart, then introduced through the conduit at the bottom of the reactor into a receiving tank the bottom of which is equipped with an O_2 supplying appts. through which O_2 is supplied into the waste water. The waste water supplied with oxygen is partly circled by pump to the reactor where the waste water is passed through an oxidn. zone and a reduction zone, and a portion of the waste water is then sent to a sedimentation tank where sludge is sepd.

The method prevents the shortage of inorganic carbon necessary for nitrification because of the utilisation of CO_2 given off during reaction and also the lowering of pH because of less reduction of alkalinity. It also obviates the need for supplying organic carbon sources in great quantities, because the BOD oxidation-decomposition, nitrification and denitrification can be performed in one reactor. 18.7.77 as 086338 (3pp117)

DORI- ★ D15 23165B/12 ★J5 4021-057

Waste water treatment - using a series of tanks contg. microorganisms fixed to biological membranes

DORIKO KK 16.07.77-JA-084654

(16.02.79) C02c-01/06

Waste water is treated using microorganisms fixed to biological membranes provided in an aeration tank. Water to be treated is passed through a number of aeration tanks arranged in series of which the first aeration tank is provided with 5-40 m^2/m^3 biological membrane and the last tank is provided with 20-40 m^2/m^3 biological membrane fixing material, i.e. equal to or more than that of the first aeration tank.

Method is used to treat organic waste water, e.g. sewage, sanitary waste, etc. in a very short time because of no occurrence of operational trouble with logging, etc. 16.7.77 as 084654 (7pp117)

Process is used for the removal of organic wastes suspended in water by biodegradation using aerobic micro-organisms, in which (i) the C, N, P and oligo-element demand and the optimum pH are experimentally determined and (ii) the same values as determined in the actual suspensi are adjusted to correspond to those required for the micr -organisms. The compsn. for the biodegradation of wastes consists mainly of vinasses, the content of N, P and C being adjusted by NH_4NO_3, $CaHPO_4$ and $CaCO_3$. It is used for treatment of mineral oil or cellulosic wastes.

For mineral oil wastes, compsn. pref. contains 40-60% vinasse, 10-12% NH_4NO_3, 3-8% $CaHPO_4$, 25-40% $CaCO_3$ and 1-3% glue. 70-200 pts. of the compsn. are pref. used with 100 pts. waste and the mixt. is combined with 10-30 times its wt. of water.

Measuring gas content in liquids - by injecting steam and measurin intensity of noise generated as pressure in bubbles alters
CHUDINOV V S 26.05.76-SU-367245
J04 R16 (03.05.78) G01n-29/02

Method of controlling the gas content in liquids, e.g. during the degassing of water has been used in the development of automation techniques. The controlling factor is the intensity of the noise which accompanies the liquid-gas phase transition process. Measurement precision is increased by introducing into the liquid, at constant temp. steam which is condensed while retaining constant characteristics.

Saturated steam, at constant parameters (flow-rate, weight compsn., temp.) is fed under constant temp. conditions into the water in which the concn. of gas is to be measured. The steam condenses rapidly accompanied by an abrupt change of pressure in the steam bubbles. This abrupt change of pressure in its turn becomes a source of audible frequency.

Sewage treatment plant with centrifugal mill - causing aeration of sewage and disintegration of solids which are subsequently sepd.
BURKETT A L 14.04.77-US-787567
P41 (13.03.79) B01d-35 B02c-23/38

Aq. raw sewage is treated in a system which includes a centrifugal mill. Here the raw sewage and air are subjected to turbulence and impact forces for aeration of the sewage and disintegration of the solids. The mill comprises a housing with a vertical bore having an inlet at the top and an outlet at the bottom.

A main shaft is vertically mounted in the bore and is attached along its length. At least one outboard shaft is vertically mounted in the bore and is also rotatable. This carries a second series of comminutors. A self-cleaning screen is connected to the outlet from the mill for sepg. the disintegrated solids.

The appts. is used to treat aq. raw sewage to produce water for non-drinking uses. The system is compact and rapidly aerates the raw sewage to satisfy its BOD. 14.4.77 as 787567 (12pp295).

Continuous-discontinuous malting and drying process for grain - with fan power and fuel consumption in drying process minimised
DE SOMER A 10.11.78-BE-871899
(01.03.79) C12c

A malting and drying system for grain or the like consists of a malting tower with four rotating germination floors, each floor equipped with distribution and extraction equipment for the malting grain which then passes onto a drying floor. The malting can take place continuously or, by extracting the germinating grain, turning and wetting it and returning it to the same floor, in a discontinuous manner. The germinating grain is fed into the malti tower from a soak bath or conventional continuous soakin system.

The malted grain is dried by means of a drying floor. A fan blows hot combustion gases upwards through the malted bed of grain which dries as it approaches the floo The dried grain passes through a heat recuperator in which some of the drying energy is recovered.

Due to the continuous/discontinuous operation, the drying air leaves the system at 100%

mising both fuel consumption and fan power. The heat recuperation yields a further saving of fuel. 10.11.78 as 871899 (F1) (9pp1370)

a-Amylase is determined by reacting a sample with a modified starch substrate contg. masked, non-reducing ends, reacting the unmasked starch with phosphorylase in the presence of PO_4^{---} to form glucose-1-phosphate, converting the latter to glucose-6-phosphate with phosphoglucomutase, reacting the glucose-6-phosphate with glucose-6-phosphate dehydrogenase in the presence of NAD or NADP to 6-phosphogluconate and NADH or NADP to 6-phosphogluconate and NADH or NADPH and measuring the NADH or NADPH. The sample may be a biological fluid, esp. serum or urine.

The method is sensitive , rapid, rel. insensitive to the presence of glucose, and has fewer stages besides being contg. operable. 30.6.77. as 729636 (4pp922)

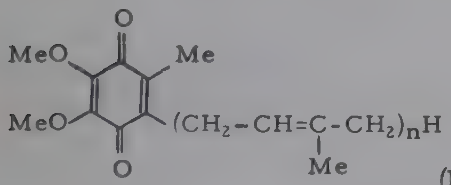
Fermentative prodn. of coenzyme/Q - using Pseudomonas microorganisms in a medium contg. e.g. iso:pentenyl alcohol or geraniol (NL 7.3.79)

AIDA K 08.04.78-JA-040812 (05.09.77-JA-105939)

B05 (15.03.79) C12d-05 C12d-13/10

Prodn. of coenzyme Q (I) is carried out by culturing a (I)-forming Pseudomonas strain in a medium contg. ⩾1 of isopentenyl alcohol, dimethylallyl alcohol, geraniol, the acetates of these alcohols, and β-methyl-crotonic acid.

The prod. is a cpd. of formula (I):



(I)

The particular prod. depends on the microorganism, e.g., P. diminuta ATCC 11568 and P. denitrificans ATCC 13867 give coenzyme Q_{10} (I; n = 10).

(I), esp. the human coenzyme Q_{10}, are useful as medicaments. The additives increase the yield of (I), e.g. by 30-40% per g. of dry cells. 1.9.78 as 838252. (20pp367)

FARB ★ D16 22393B/12 ★EP ---1-099

Continuous sucrose conversion to iso:maltulose - during continuous fermentation of iso:maltulose forming microorganisms with addn. of sucrose-contg. solns.

BAYER AG 14.02.78-DT-806216 (13.09.77-DT-741197)

C03 E13 (D13 D17) (21.03.79) A23k-01 C07h-03/04 C12d-13/02

D/S: BE, CH, DT, FR, GB, NL, SW.

Sucrose-contg. solns. are added continuously to a medium in which isomaltulose-forming microorganisms (I) are cultivated continuously. Cultivation is continued in a standard manner. After sucrose conversion, the soln. is separated from the microorganism mass, purified by a standard method and/or crystallised.

Isomaltulose is an intermediate for the prepn. of glucopyranosido-1,6-mannitol and glucopyranosido-1,6-sorbitol. Both cpds. may be used as sugar substitutes. The bacterial mass separated may be used as cattle fodder.

The cultivation of the microorganisms and sucrose conversion to isomaltulose take place simultaneously. The bacteria grow quickly on reaching the steady state. 90-100% conversion to isomaltulose is achieved. Sucrose-contg. plant juices, cheaper than pure sucrose-contg. solns., may be used. Bacterial growth and conversion can be controlled by only one critical parameter, e.g. CO_2 content in waste air, O_2 partial pressure in culture soln. and/or conversion rate. Fructose and glucose are formed during conversion to isomaltulose, obviating the need for adding carbohydrate sources.

1.9.78 as 10080 (12pp200).

Protease production from bacillus species o-20

OTSUKA KAGAKU YAKUHIN (OTS -) 30.10.68-JA-079413
*(28.02.79) *NL6916-325 C12d-13/10 +C07g-07/02*

Process comprises cultivating Bacillus sp-O-20 (FERM-P 270) in a culture medium to accumulate the protease in the culture medium and then recovering the protease from the medium.

The culture medium contains glucose, etc. as sugar component, soybean oil cake, corn steep liquor, etc. as N source, potassium hydrogen phosphate, potassium chloride as a salt component, etc. The cultivation is conducted at pH 6.8-7.0 at 32-35°C for 1-3 days under shaking or aerobic condition. The resulting mixt. is subjected to pptn., salting out, dialysis, concn., ion exchange resin treatment, etc. to give pure protease. The protease is inhibited by EDTA and stable against Ca ion. It has activity against casein, fibrin, gelatin, albumin, etc.

In an example, 1.4 g. of Na_2HPO_4, 1.0 g. of KH_2PO_4, 20 g. of NaCl, 0.1 g. of $MgSO_4$, 6.0 g. of Na glutamate and 10 g. of glucose were dissolved in 1000 ml. of water, and adjusted to pH 7.0. In the resulting medium, Bacillus sp-O-20 is cultivated at 30°C for 3 days with shaking. The resulting mixt. was subjected to centrifugation to give supernatant. 30.10.68 as 079413. Antibiotic H-60 prepn. from Streptomyces microorganism - by aerobic cultivation in medium contg. carbon and nitrogen sources, inorganic salts etc.
KAKEN CHEM KK 29.12.70-JA-120899
_B04 (28.02.79) A61k-39 C12d-09/14_

Microorganism Streptomyces sp H-60 is cultured in a culture medium to produce the antibiotic H-60, and the antibiotic is recovered from the culture medium. The microorganism Streptomyces sp H-60 is FERM No. 768. The culture medium contains carbon source, nitrogen source, inorganic salt, inorganic components, antifoaming agent, etc. Cultivation is conducted at 25-35°C under aerobic condition for 72-120 hrs. The culture broth is filtered and treated with absorber such as activated carbon, ion exchange resin, etc. Elution is conducted with the use of acid, alkali, etc.

The antibiotic has the following properties: white amorphous powder, decomposed at ⩾180°C, soluble in water, sparingly soluble in methanol, insoluble in acetone, butanol, ethyl acetate, benzene, etc., specific rotation $[\alpha]_D^{25}$ = +43°, mol. wt. of 470, elementary analysis of C 44.30%, H 7.50%, N 12.21%, positive to Ninhydrin reaction, Molisch reaction, negative to Pherling reaction, Tolence reaction and Biuret reaction. The antibiotic appears to be the same as known antibiotic SF-733. 29.12.70 as 120899. C12d 9/14; A61k 39/00 (28.2.79) KAKEN CHEM KK (5pp22)

*J08 Q76 (15.03.79) *NL7107-488 F26b-03/12*

A spray drying process for the production of granules, for example of sugar from a sugar solution, maintains a fluidised bed of dry particles in a vertical tank by hot primary gas. Hot secondary gas is admitted tangentially downwards in a narrower cylindrical part on top to create a vortex which ends at the fluidised bed. The fresh solution is sprayed into the laden ascending stream of primary gas.

This results in a thorough drying effect and in the production of granules with a fixed minimum of unit weight. 25.5.71. as 125945 (5pp39)

Reclaiming leather wastes - by breaking up into fibres, dispersing in water, beating, and forming into sheet, opt. with unbeaten collagen fibres

HONSHU PAPER MFG KK 14.07.77-JA-083607

F08 (15.02.79) C14b-07

The method comprises (a) crushing leather dust, (2) breaking it up into fibres in the dry state, (3) dispersing the obtd. collagen fibres in water, (4) beating them to freeness 100-600 ml (Canadian standard) and (5) forming the beaten collagen fibre alone or together with unbeaten collagen fibres into a sheet. The leather dust which is inevitably byproduced in leather industry and has been discarded is utilised effectively and thus obtd. reclaimed leather shows similar properties as natural leather.

Firstly leather dust is crushed into fine pieces of 5-10 mm size and the breaking up is pref. carried out on the pieces of moisture content $< 30\%$. The breaking up is pref. effected by a method, in which leather powder is not formed and obtained collagen fibre has 5-30 mm in length and 30-60 μ. The obtd. collagen fibre is dispersed in water and is beaten in the slurry of 2% concn. The collagen fibre obtd. by unfastening leather dust without forming powder, has the proper freeness of Canadian standard and can be easily mfd. in sheets. 14.7.77 as 083607 (7pp5)

MELY/ ★ D18 23592B/12 ★SU -604-871

Twisted belts forming unit - has die with semi-cylindrical, and punch with two half-cylinders, as working surfaces

MELYAKOV V S 26.04.74-SU-024791

Q35 (30.05.78) B65f-01 C14b-01/02

The prodn. of coiled belts of improved quality involves forming the blank in a die whose working surface is semi-cylindrical. The working surface of the punch is formed by two semicylinders and both the die and the punch have inner rollers. The advance mechanism comprises a spring-loaded lever and a worm gearing mounted on the lever in line with the unit for holding and turning the belt.

The belt is pierced at one end and threaded on to the
hook, and after raising the punch the belt is placed and the
pedal is released. Pressing another pedal engages a shaft
to shift the lever, while gears impart rotation to sprocket
meshing chains that are linked by platforms. The move-
ment of rollers along the guides ensures rotation of the
hook with the belt, which is drawn through the punch and
die to fold the edges. The turning of the hook imparts
twist to the belt.

Cosmetic compsn. for hair or skin contg. cationic polymers - including novel polymers, contg. two quat. nitrogen atoms

L'OREAL SA 20.09.77-LU-078153
A96 (19.03.79) A61k C08g

A cosmetic compsn. for the hair or skin contains ≥1 polymer contg. moieties of formula (I):

$$-[\underset{\oplus\ X^{\ominus}}{N}(R_1)(R_2)-A-\underset{\oplus\ X^{\ominus}}{N}(R_1(R_2)-(CH_2)_n-CO-B-(CH_2)_n-]- \qquad (I)$$

In (I), A is alkylene, hydroxyalkylene, alkenylene or alkynylene; B is either (a) -OZO- where Z is aliphatic hydrocarbyl or $-[CH_2CH_2O]_x-CH_2CH_2-$ or $-[CH_2CH(CH_3)-O-]_y-CH_2CH(CH_3)-$ where x and y are 1-4; (b) a bis. sec. diamino residue such as 1,4-piperazinyl; (c) a bis prim. diamino residue of formula -NH-Y-NH- where Y is aliphatic hydrocarbyl or $-CH_2CH_2-S-S-CH_2CH_2-$; or (d) -NHCONH-; R is 1-4C alkyl; R_2 is 1-12C aliphatic hydrocarbyl or the radicals R_2 with A and the 2 N atoms can form 1,4-piperazinyl or 4,4'-dipiperidinyl; X is halogen, pref. Cl or Br and n is 1-10.

Compared with previous similar polymers, the above have better compatibility with anionic surfactants and can be eliminates from the hair by normal treatments. 19. 9. 78 as 870586 (36pp597)

Disinfection chamber evaporator

VIBRASUG AB (VIB -) 09.04.69-SW-005003

*P34 (15.03.79) *DT2016-698 A61l-03/02*

A disinfection chamber for disinfecting rooms includes an electrically heated, elongated evaporator chamber. The evaporator channel contg. the heating elements is designed as a temp. probe, because it is fixed at one end and is free to expand at the other end. Its thermal elongation operates a spring-loaded lever which can thus be moved between a switch to actuate the heating element and a switch to actuate the motor for a pump to pump disinfectant (formalin) into the evaporator channel. 8.4.70. as 016698 (8pp39)

PROP/ D22 34213X/19 =DS 2451-093

Temporary prevention of refuse rotting - by treatment with mixt of naphthenic acids or their salts and petroleum prods.

PROPFE H 28.10.74-DT-451093

*E15 G02 P34 (15.03.79) *DT2451-093 A61l-11*

A highly viscous mixt. of naphthenic acids and their salts and the high boiling constituents of crude oil distn. of mol.wt. > 550 is used in an amt. of 0.5-5 wt.% (based on the waste) to preserve temporarily household or industrial waste. The naphthenic acids have mol.wt. 300-550 and may be mono- or di-acids of 6-30C cycloparaffins.

The mixt. reduces smell in waste waiting to be processed. 28.10.74. as 451093 (3pp068)

FARB D22 09739A/05 =DS 2631-352

Radiation sterilisation in solid-particle-free atmos. - in airlocked oven with turbulence-free finely filtered airflow

BAYER AG 13.07.76-DT-631352

*P34 +P33 Q31 Q77 (15.03.79) *NL7707-699 B65b-55/08*

Containers, e.g. glass bottles to be filled with parenteral medicine, are sterilised by passing them via laminar flow units through a steriliser zone, sterilising them by radiant heat, and cooling them by air which has been filtered through high-duty suspension filters.

A part of the filtered air is branched off and is passed in a low-turbulence flow parallel to the movement of the containers through the radiant heater. This is a low-cost (investment and operation) soln. for the task of keeping the particles of <1 µ to the order of one per litre of air. 13.7.76. as 631352 (5pp39)

HOLT/ ★ D22 22231B/12 ★DT 2739-966

Removal of odour and toxic substances - by burning the substance absorbed on a refractory carrier

HOLTER H 06.09.77-DT-739966 (00.00.77-DT-705533)

E19 J01 (15.03.79) B01d-53/14

In the parent application, waste gas contg. odours and toxic substances such as amines, ammonia, phenols, and formaldehydes are treated by contacting with a combustible carrier which is impregnated with an absorbent and subsequently burnt to remove these substances. In this addn, the carrier is not burnt but recovered and used agakn for the absorption process. The carrier is made of a refractory material which is porous and can be impregnated with the toxic substance in the form of a liq. Pref. the carrier is composed of expanded perlite.

Method is more economical as the carrier is recycled to the process. Used for the removal of odour and toxic substances such as amines, ammonia, phenols, and formaldehydes from waste gases or air. 6.9.77 as 739966, Add. to 2705533. (5pp095)

BIOM- ★ D22 22267B/12 ★DT 2741-317

Anodic oxidn. sterilisation of fluids - after increasing conductivity by carbon di:oxide introduction

INST BIOMED TECH 14.09.77-DT-741317

P34 (15.03.79) A61l-01

The sterilisation process of fluids in anodic oxidn. cells is severely impeded if the fluid has a low or no electrical conductivity, e.g. distilled water. This is remedied by introducing into the fluid carbon dioxide through a gas exchanger. The conductivity is increased enough (e.g. by a factor of 50) to apply the anodic oxidn. process. The carbon dioxide is finally removed by an inert gas aeration. 14.9.77 as 741317. (5pp39)

Heatable article for application to the body - having a layer of wax melted by a heating element incorporated in the article

BRISTOL MYERS CO 09.09.77-US-831839
P24 P32 R59 (21.03.79) A45d-02/46 A61f-07 H05b-03/34
D/S: BE, CH, DT, FR, GB, LU, NL, SW.

An article, for heat treating an area of the body, comprises inner and outer plastics layers between which are located a wax layer, a heating element and a layer of insulating material. In use, the wax layer is closest to the body. The wax layer may be of modular form and retained between a pair of plastics sheets, the heating element may be an electric heater, and the insulating layer may be a fibrous material or a heat reflective sheet.

The article is used by heating the wax to melt it, switching the heater off, and applying the article to the body to treat the body with the heat of fusion of the wax as it resolidifies. During the application the heating is switched off, unlike articles of the prior art.

Sliding door with inflatable seal for steriliser - restrained at upper and lower ends and inclined slightly to steriliser opening in open position
BETTER BUILT MACHIN 09.09.77-US-831768
A88 Q67 (21.03.79) F16l-13

A sterilizer comprises an enclosure having an access opening which mounts guide tracks on opposite sides. A rigid door is of slightly larger dimensions than the opening and mounts roller members on opposite sides for movement in the guide tracks.

A restraining flange restrains the door against outward displacement by the pressure of steam within the sterilizer chamber. Fluid actuated flexible seals pref. of ethylene, propylene or silicone rubber surround the opening of the sterilizer to engage the door during sterilising.

Used for sterilization of hospital and labortory glasswear, liquids, instruments, surgical gowns. The door is restrained only at two faces which avoids the necessity for heavy structural steel restrains. The door is strengthened by stiffeners which cuts down the amt. of material used without sacrificing strength. The door retracts slightly from the front face of the sterilizer to provide a spacing which allows broken glass which accummulates in the open -ing to drop down to the floor. The glass does not therefore become embedded in or abrade the sealing member. 22.8.78 as 034221 (10pp1044)

Lubrication of surgical devices - by coating surfaces with sodium potassium carbonate, acetate, citrate or bi:carbonate

STERNLIEB J J 25.10.77-US-844726

A96 B07 E12 P21 P32 (E34) (13.03.79) A41d-19 A61f-13 C1 01/10 C10m-03/18

Surgical devices of plastics, natural or synthetic rubbe are surface coated with Na or K carbonate, bicarbonate acetate (or the corresp. hihydrate) or citrate dihydrate.

The coating acts as a lubricant but it does not cause adverse reactions in animals or humans. Installation of the devices is eased and self-adhesion of the devices on storage is prevented. The coating is used instead of the usual talc or cornstick, with their known disadvantages. The coating also acts as an inhibitor of bacteria and moulds. 25.10.77 as 844726 (3pp1248).

Orthopaedic bandage assembly - comprises fabric carri softenable polymer compsn. and perforated separator to prolo cool down time

HEXCEL CORP 22.08.77-US-826437

A96 P32 (A13 A17) (13.03.79) A61f-05/04

An orthopaedic bandage assembly includes a length of a pliant fabric carrier formed by strands of a relatively bulky material which define openings having an area 0.010 in^2. The strands are coated and at least partially impregnated with a polymer compsn. which is heat softenable. The assembly also includes a separator made o a material that is readily separable and releasable from the heat softenable composition. The separator is relatively thin and has apertures which are smaller than the carrier openings.

The coated carrier and the

nto a roll so that the separator separates consecutive urns of the carrier. To form a cast. the roll is sub ged in heated water to heat the compsn. above its softenng temp. The water can glow through the carrier openngs and separator apertures to the roll centre to speed ip the softening process. The roll is then removed from he water and the separator is discarded to allow the carrier to be applied to the patient.

The separator prolongs the cool-down time of the carrier to extend the time for forming the cast. 22.8.77 as 826437 (8pp1405).

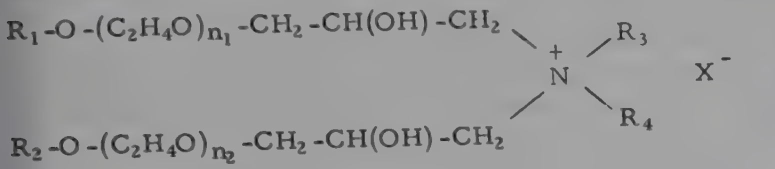
BERP ★ D22 23810B/12 ★US 4144-122

Cellulose pulp fibre web of low mechanical strength - obtd. by treating slurry with a quaternary ammonium cpd.

BEROL KEMI AB 29.11.77-US-855587 (10.11.72-US-306250)

A97 E16 F09 (A25) (13.03.79) D21d-03

A cellulose pulp fibre slurry is treated, prior to or during formation into a web, with a quat. ammonium cpd. of formula (I)



(I)

where R_1 and R_2 are 8-22C aliphatic hydrocarbon gps., R_3 and R_4 are Me, Et or hydroxy-ethyl; n_1 and n_2 are 2-10; and X^- is a salt-forming anion; and the formed web is dried.

The treatment reduces inter-fibre bonding and imparts a low degree of mechanical strength to the web, while at the same time preserving good hydrophilic properties. The treated cellulose may be defibrated into fluff and used in hygienic prods. such as diapers, absorbent or sanitary pads or tampons. 29.11.77 as 855587 (+ 17.10.74; 22.10.76 - US - 515738; 734798) (6pp558).

DOWC ★ D22 23849B/12 ★US 4144-211

Solid complex of oxazoline or oxazine polymer and halogen - which is soluble in water or organic solvent e.g. to form disinfectant

DOW CHEMICAL CO 06.09.77-US-830529

A26 (13.03.79) C08g-73/06 C08l-79/04

Solid complex comprises (a) a poly-2-oxazoline or poly-2-oxazine and (b) a halogen, interhalogen, or pseudo-halogen.

The complexes are soluble in water and a variety of conventional solvents (including CH_2Cl_2, acetonitrile, MeOH, THF and i-PrOH), and some serve as excellent sanitising and antimicrobial agents. When dissolved, the complexed halogen retains its chemical activity although the complexes themselves are quite stable. Thus the dangers associated with the handling of volatile halogens are substantially diminished. The complexes also increase the solubility of the halogens in various solvents in which they normally have low solubility. 6.9.77 as 830529 (4pp914).

Basic ester(s) of amino-carboxylic acids and aliphatic poly:ol(s) - esp. for use as surfactants in dyeing of textiles
BAYER AG 01.09.77-DT-739343
A60 E16 F06 (15.03.79) C07c-93/04 C07c-101/02 C07h-13/02 D06p-01/62

New surfactant esters of aliphatic polyols with $\geq$5C with opt. quaternised amino-carboxylic acids in which $\geq$1 N atom is substd. with a hydrocarbon gp. contg. $\geq$8C and opt. interrupted by hetero-atoms and for CONH gps.

As detergents, emulsifiers, wetting agents, thickeners and esp. as aids in dyeing or printing of textiles from natural or synthetic fibres, esp. wool, silk and synthetic polyamides. The esters completely biologically-degradable, causing no pollution of effluents, and also low- or non-foaming. 1.9.77 as 739343. (25pp195)

FARH ★ D25 22228B/12 ★DT 2739-916
Mixed acid orthophosphate ester prodn. - from phosphorus pentoxide and excess of alkanol and poly-ol, useful e.g. in cleaning compsns.
HOECHST AG 05.09.77-DT-739916 (00.00.76-DT-645211)
E11 (15.03.79) C07f-09/09

The parent patent describes prepn. of a mixt. of acid orthophosphate esters by reacting P_2O_5 with a mixt. of a monovalent alcohol (I) and a 2-12C alkanepolyol (II) with 2-6 OH while keeping a P_2O_5:(I):(II) mole ratio 1:2:4/n (n = no. of OH gps. in (II)).

The reactants are mixed or kneaded at 0-120°C with exclusion of moisture and under an inert gas for 1-6 hrs., then the mixt. cooled. In this addn. (I) and/or (II) is used in molar excess relative to P_2O_5.

The mixts. are useful as components of acid cleaning compsns. because of their relatively low corrosivity. They can also be used, opt. after neutralising, as emulsifiers, wetting agents, lubricants, foam-suppressants, antistatics, and (if they contain halogen) as intermediates for flame-proofing agents.

By using an excess of alcohol the viscosity of the mixt. is reduced so side reactions leading to coloured impurities are suppressed. 5.9.77 as 739916, Add. to 2645211. (14pp1251)

KAOS D25 85014Y/48 =GB 1542-387
Cleaning compsn. for removing viscous dirt or wax stains - comprising aq. mixt. of phosphate ester, alkali and anionic and/or nonionic surfactants
KAO SOAP KK 11.05.76-JA-053684
*A97 E11 (E16) (21.03.79) *DT2717-928 C11d-03/36*

A detergent compsn. comprises 0.1-10 wt.% $\geq$1 organic phosphoric acid ester of formula (I) where n is 1, 2 or 3,

$O=P-(-O-(CH_2CH_2O)_nC_mH_{2m+1})_3$ (I) and m is 2, 3 or 4; and 0.1-20 wt.% ≥ 1 of ammonia, and alkanolamine of formula $NHn'(Cm'H_2m'OH)_{3-n'}$, where n' is 0.1 or 2, m' is 2 or 3 and a water-soluble inorganic alkaline agent; 0.1-10 wt.% ≥1 water-soluble organic anionic surfactant and a water-soluble organic non-ionic surfactant; and water.

Pref. ester is tris-2(2 butoxyethoxy)ethyl phosphate or tris-2 (2-ethoxyethoxy) ethyl phosphate. Second component is ammonia or monoethanolamine.

Detergent prod. is esp. useful to remove, rapidly and completely, sticky or solid household stains esp. of cooking oils and fats. 13.4.77 as 015306 (5pp931)

PROC D25 88763X/48 =GB 1542-456
Aq. composn. for refreshing slightly soiled clothes - by spraying and drying pref. in automatic drier
PROCTER & GAMBLE CO 05.05.75-US-574658
*A97 E34 G04 +Q76 (E19) (21.03.79) *BE-841-479 D06m-11/04 D06m-15/10*

A process for freshening and deodorising wrinkled or lightly soiled fabrics comprises commingling fabrics under heat in a fabric dryer with an effective amt. of fabric freshner compsn.

Compsn. contains 1-10 wt.% water-soluble deodorant of alkali metal bicarbonate and carbonate salts or mixts.; 0.5-5 wt.% ethoxylated nonionic antistatic agent; 0-10 wt.% fabric treating adjunct agent other than the antistatic agent or deodorant; balance of water. Pref. compsn. is applied in amt. 0.02-2.0 g per gram dry wt. treated fabric.

Compsn. is prepd. for use in aq. laundry bath. 4.5.76 as 018171 (6pp931)

PROC D25 05092Y/03 =GB 1542-696
Clear stable, liq. washing agents for cold water use - contg. anionic and nonionic wash active agents and opt. alkanolamine
PROCTER & GAMBLE CO 19.02.76-US-659608 (30.06.75-US-591987)
*A97 E19 (21.03.79) *NL7607-160 C11d-01/12 C11d-03/43 +C11d-10/02*

A clear stable single phase heavy duty liq. detergent compsn. is prepd. contg. 10-50 wt.% w.r.t. free acid form of anionic detersive surfactant which is a sulphate, a sulphonate or their mixts.; magnesium or calcium ions (or mixts.) to neutralise ≥ 75% free acid; 5-50 wt.% nonionic surfactant prepd. by condensation of 2-15 moles ethylene oxide with 1 mole of prim. or sec. 8-18C straight- or branched-chain alkyl, having HLB of 8-18; 0-10% alkanolamine contg. 2-4C alkanol moiety; balance contg. mixts. of water and water-soluble solvents to lower viscosity to 300 cP.

Compsn. has ≥ 35 wt.% anionic surfactant plus nonionic surfactant, being free of agents causing phase separation and/or gelling.

Prod. is used in cool water fabric laundering. 29.6.76 as 026991 (13pp931)

PROC D25 01850Y/01 =GB 1542-697
Clear, single phase, heavy duty liquid detergent compsn. - contains alkaline earth cations to replace the alkanolamines previously used to avoid brightener pptn.
PROCTER & GAMBLE CO 30.06.75-US-592009
*A97 E24 (21.03.79) *US3998-750 C11d-01 C11d-03/02 +C11d-10*

A homogeneous, single-phase, heavy-duty liq. detergent compsn. is prepd. contg. 10-40 wt.% anionic detersive surfactant or mixts. w.r.t. free acid form; sufficient magnesium or calcium ions or mixts to provide electrical neutrality for free acid form of anionic surfactant; 10-50 wt.% ethyoxylated nonionic detersive surfactant or mixts.; 0.1-1 wt.% water-soluble bis(styrylsulphonate) biphenyl brightener or its water-soluble salt; balance of liq. carrier as water or mixts. of water in miscible solvents.

Compsn. is free of agents at levels causing phase separation or brightener pptn.

Liq. detergent is prepd. contg. effective brightener with clear, homogeneous, builder-free properties. 29.6.76 as 026994 (15pp931)

LIOY ★ D25 23205B/12 ★J5 4021-40
Detergent compsn. contg. alpha-olefin sulphonic acid magnesium salt - is useful for washing cloth or tableware and has good detergent properties
LION FAT & OIL KK 19.07.77-JA-086239
E17 (E12) (17.02.79) C11d-01/37

Compsn. which comprises a magnesium salt mixt. of 10-20C α-olefinsulphonic acids of average chain length 13.5-16C. The amt. of magnesium salt of α-olefinsulphonic acid with a chain length of 14C is 25-75 wt.% and that of disulphonic acid salt 3-13 wt.%.

Magnesium salt of α-olefinsulphonic acid is formed by e.g. sulphonating 10-20C mixed α-olefin with gaseous sulphuric acid anhydride diluted with inert gas, neutralising it with magnesium hydroxide or magnesium oxide, and then hydrolysing it. The ratio of Mg alkenesulphonate to Mg hydroxyalkanesulphonate is 40-60 to 90-10, pref. 50-5 to 80-20. The detergent compsn. may also contain surfactant or additive (e.g. 10-18C alkylbenzenesulphonate, silicate, sodium carbonate, etc.).

The detergent compsn. is excellent in washing powder, foaming, rinsing, finish feeling and biodegradability. 19.7.77 as 086239 (6pp50)

ASAH D25 95088X/51 =J7 9003-676
Porous capsular structure - has specified dimensions and filter pore size to improve the discharging of the nucleus substance
ASAHI CHEMICAL IND KK 13.02.75-JA-017439

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

**ough rolling machine - with belt-type stretching units separated by
utes and elevator with flights**
KASPER J 27.11.74-DT-455997
*(22.03.79) *DT2455-997 A21c-07/**

a machine for the rolling-out and elongating of dough
r the manufacture of pretzels, adequate time must be
llowed for the stresses induced in the dough to be relie-
ed. The first endless-belt operated rolling-out station
erefore discharges the dough on an inclined belt convey-
r with flights, pref. at an angle of 60°. During its travel
this, the dough is exposed to a hot air stream. A chute
lso at ana angle of 60°) discharges the dough to the se-
ond rolling-out station, with an active upper and lower
trand of the belt before the dough is discharged on the
orktable.
This prevents tearing of the dough rolls. 27.11.74. as
55997 (6pp39)

UND- ★ D11 24043B/13 ★DS 2815-417
**ass produced cake mould - bent from flexible material and fixed
y punchings**
GUNDLACH E KG 10.04.78-DT-815417
(22.03.79) A21b-03/13

cake mould is made from strips of flexible material
hich are extracted from a magazine and passed through
station where one end is slightly turned over and ripp-
ed. In the next station each strip is bent to a ring and
ixed together by four partly punched out and bent out-
ard circles. These four punched circles are arranged
a square. The turned-over flange is finally used to
upport a bottom disc.
This required few tools and is ideal for mass prodn.

**Waffle moulding machine - with roll faces sealed by block with
urved scraper recesses**
DANGER H KG 14.09.77-DT-741294
(22.03.79) A21b-05/02 A21c-09/04

A waffle moulding machine with contrarotating rolls pre-
vents the leakage of the sugary mass at the face ends of
he rolls by spring-loaded sealing blocks with scraper re-
cesses. These recesses are curved and extend from out-
side the roll periphery to a point above the roll gap.
This prevents any leaking mass from contaminating the
conveyor for the waffle discharge or from accumulating at
other undesirable spots. It avoids the use of lip seals
which have a short life because of the abrasive nature of
he mass. All parts are easily detachable for cleaning.
4.9.77 as 741294. (14pp39)

RRR ★ D11 24151B/13 ★DT 2800-310
**akery products for use with e.g. milk instead of known cereals -
repd. by baking in hot air spherical bodies made from pref. yeast-
ree dough contg. proteins**
FERRERO P & CIA SPA 21.09.77-IT-069082
(22.03.79) A21d-13/08

Pref. spherical, seam-free bakery prods. having a dia. of
10-20 mm. are produced by baking pref. in hot air (not in
a boiling fat) spheres formed pref. from a yeast-free
dough contg. egg-white. The surface of these prods. is
relatively impermeable to air and moisture. The prod.
has relatively coarse pores decreasing from the inner to-
wards the surface. The moisture content is below 1%.
This prod. can also be used for coating other food prods.,
(e.g. chocolate or cream).
These prods. are pref. used as additives for e.g. milk
or fruit juices instead of the known cereals. They are not
ively fatty, as they contain only the moderate quantity of fat contained in the dough. They are not imbried with liqs. and, hence, they float on the surface and remain crisp. 4.1.78 as 800310. (7pp70)

RIKV ★ D11 24717B/13 ★J5 4023-167
Choux mix - including mix of dry powdery gluten contg. oil and fat and starch
RIKEN VITAMIN OIL KK 25.07.77-JA-089100
(21.02.79) A21d-13/08

Dry powdery choux mix comprises a mixt. of dry powdery gluten including oil and fat and starch or a compsn. obtd. by combining ≥1 kind of powdery oil and fat prepd. by using sodium casein as the major powdering agent, powdery skimmed milk, sodium casein and sugar to the mixt. as above.

Powdery choux mix is convenient to handle and has excellent keeping properties and with it excellent dough for choux can be prepd. 25.7.77 as 089100 (5pp5)

Bread of improved quality and storage life - is obtd. by adding mono-glyceride ester to the dough during initial and final stages of prepn.
BREAD BAKING IND (MOFA=) 24.09.76-SU-408667
(17.04.78) A21d-08/04

Bread is manufactured by blending flour and various additives, incorporating a dispersion contg. monoglyceride esters, fatty acid monoglycerides, sugar and vegetable oil. Quality is improved and storage life extended by mixing the dispersion with water in the ratio 1:2-1:4 at 35-45°C and introducing it in small amts. both at the beginning and end of the mixing process. In this way blending is conducted with sp. energy expenditure of 40-50 J/g dough.
Goryacheva, A.F., Shkvarkina, T.I., Semenova, V.S. et al. Bul. 17/5.5.78. 24.9.76. as 408667 (2pp835)

HANS/ ★ D11 25646B/13 ★US 4111-624
Imprinting irregularly spaced dough pieces - by passing pieces on conveyor past sensor then releasing frictionally driven print wheel
HANSON D R 28.10.76-US-736382
(05.09.78) A21c-11/02

A dough imprinting device includes a conveyor for carrying dough pieces through an imprinting station. Upstream of this station is a sensor which detects the presence of a dough piece on the conveyor. The imprinting station comprises a rotating head carrying the imprinting design.

Although the shaft of the imprinting head rotates continuously a slipping clutch allows the imprinting head to be held stationary by a latch. When a dough piece is sensed the imprinting head is unlatched after a predetermined delay and applies the design to the dough piece as it passes beneath it.

The appts. applies an imprint e.g. a trademark, to a dough piece. The appts. prints on parallel lines of dough pieces using independently activated sensors and corresp. imprint heads. The appts. can imprint accurately on irregularly spaced dough pieces on the conveyor. 28.10.76 as 736382 (12pp295)

POPJ ★ D11 25832B/13 ★US 4112-127
Dough processing - by passing repeatedly through pair of parallel rollers with adjustable spacing
POPEIL BROS INC 09.07.76-US-703918
(05.09.78) A21d-08/02

The method comprises mixing the dough and kneading it until the required consistency is achieved. The dough is then preformed using an open-ended blank cutter which is filled to overflowing with the dough and is then passed between a pair of opposed rollers to form a blank. The blank is removed from the cutter.

The blank is then passed between the rollers repeatedly until it is flat and dimensionally stable. The spacing between the rollers is next reduced and the dough again is reprocessed until it has the desired thickness. The flattened dough body is then positioned on an open-faced mould having upstanding cutting edges. The rollers are readjusted t accomodate the open-faced mould which is then passed between the rollers to sever the dough into its desired configuration.

The appts. is used to form dough into noodles or raviol The appts. may be used in the home. 9.7.76 as 703918 (7pp295)

KURE D12 39246W/24 =DS 2501-287
Curved plastic sausage casings - by inflating non-drawn thermoplastic tube as it advances along cylindrical shaping device
KUREHA KAGAKU KOGYO 19.01.74-JA-008704
*A97 (A14) (22.03.79) *BE-824-476 B29c-17/02*

Prodn. of crimped, heat treated thermoplastic foil tube, esp. from vinylidene dichloride copolymers, comprises continuous extrusion of these plastics in tubular form, machining the external surface to obtain a helical or screw pattern (pref. 1-4 times the length of the tube), followed by release of stress in the surface. 15.1.75. as 501287 (6pp047)

TECH- D12 88029A/49 =DS 2724-394
Individual clip separating machine - with fingers on endless chain passing through slot in clip magazine
TECHNOPACK EWALD HA 28.05.77-DT-724394
*Q35 (22.03.79) *DT2724-394 A22c-11/12 B65g-47/14* .

Machine to extract U-shaped clips from a magazine one-by-one and to feed them in proper alignment to a sausage closing or a packaging machine has an endless chain with finger flights which pass through a bottom slit in the magazine and have at the end a notched recess for one clip. A guide strip allows each flight to dip into the magazine to the multiple thickness of a clip. In the further path, the guide strip draws nearer to the end of each flight until finally it allows just one clip to hang in the notch. This is aligned by side strips.

The device is reliable and simple. 28.5.77. as 724394 (4pp39)

ANDE/ ★ D12 24224B/13 ★DT 2839-719
Poultry liver and heart separation - from gall bladder and guts by slotted chute and revolving cutter (NL 16.3.79)
ANDERSEN B C 14.09.77-DK-004073
(22.03.79) A22b-05 A22c-21/06

A device for the sepn. of the liver and heart of poultry from the guts and gall bladder consists of two parallel strips which leave a gap between them. The gap is such that the guts fall through but liver and heart remain above it. These strips are first steeply inclined and then flatten out as they approach a rotating cutter disc which severs the two parts.

This saves damage to the gall bladder which spoils the innards, saves damage to the liver, and saves manual labour. 13.9.78 as 839719. (9pp39)

NISH- ★ D12 24713B/13 ★J5 4023-158
Food prepd. from milt of fish and shellfish - by adding sodium chloride, poly-phosphate, ethanol, and antioxidant and kneading the mixt.
NISHIMURA KK 20.07.77-JA-086048
(21.02.79) A23l-01/32

Common salt, polyphosphate, ethanol or ethanol-contg. substance and antioxidant are added to the testiculus (milt) of fishes or shell fishes. Then, the mixt. is kneaded to a paste.

The testiculus of fishes and shellfishes is delicious and rich in precious nucleoprotein. However, previously it has been discarded because it is easily oxidised or autolysed, and its processing and preservation is difficult. This method is used for prepn. of delicious, nutritive food from testiculus of fishes or shell fishes, such as salmon, cod, scallop, etc., with prevention of oxidation, autolysis and putrefaction of the testiculus. The obtd. food can be preserved by freeze-storage, refrigeration-storage, etc.

Common salt, polyphosphate and antioxidant (e.g. L-ascorbic acid, its salt, erythorbic acid and its salt) are added in amts. 2-10 w/w%, 0.2-0.5 w/w% and 0.5-2 w/w% and 0.5-2 w/w% respectively w.r.t. wt. of testiculus (milt). As ethanol-contg. substance, wind, 'sake', etc. can be used and it is combined so that the ethanol concn. in the paste is 5-10%. Antioxidant is used to stabilise the testiculus, and common salt and ethanol are used to prevent putrefaction. Further the fishy smell can be masked with ethanol or ethanol-contg. substance, and polyphosphate is combined to maintain good pasty condition. 20.7.77 as 086048 (3pp5)

SHIM- ★ D12 24714B/13 ★J5 4023-159
Preserving Crustacea or coloured fish - using compsn. contg. sodium bi:sulphide or sodium sulphide
SHIMAKYU YAKUHIN KK 19.07.77-JA-087025
(21.02.79) A23b-04/02

Pref. < 20 pts. wt. L-tryptophane is used with 100 pts. wt. sodium bisulphide for better freshness-retaining effect. A binder such as sodium polyphosphate, acidic sodium pyrophosphate or sodium metaphosphate 5-15 pts. wt. on 100 pts. wt. sodium bisulphide or sodium sulphide is also used.

The compsn. is used as an aq. soln. or aq. saline soln. having a concn. of sodium bisulphide or sodium sulphide of 0.1-3.0 w/w% esp. 0.3-0.5 w/w%. Crustacea or coloured fish are immersed in the soln. for 5-10 secs. at room temp.

Residual sulphur dioxide in the treated Crustacea or fish is as low as < 10 ppm. 19.7.77 as 087025 (5pp5)

NIKK- ★ D12 24715B/13 ★J5 4023-162
Sausage prepn. - by adding coagulated milk protein to meat mixt.; adding skimmed milk and lactic acid bacteria; kneading; packaging etc.
NIKKEN FOOD 19.07.77-JA-086545
(21.02.79) A22c-11 A23l-01/31

Process comprises (1) inoculating lactic acid bacteria starter in cow milk or skimmed milk previously sterilised (2) fermenting; (3) adding thus obtd. coagulated milk protein ca. 10% in meat material; (4) adding powdery skimmed milk and lactic acid bacteria to the mixt.; (5) kneading the mixt. to obtain an emulsion; (6) packaging in casings; (7) tieing them up; (8) drying and smoking them at 32°C for 20-24 hrs.; and (9) boiling or steaming.

Additional preservatives such as Na nitrite need not be added. 19.7.77 as 086545 (4pp5)

NITT- ★ D12 25062B/13 ★J5 4024-898
Collagen sol prepn. - by dipping animal tissue in acidic soln., heating, finely dividing and treating with caustic soln. in presence of swelling retarder
NITTA GELATIN KK 26.07.77-JA-089531
(D18 D22) (24.02.79) C09h-03

Collagen sol. prepn. by dipping broken pieces of connective tissue of animals in an acidic soln. at pH $\leqslant 3$, heating the pieces at $\leqslant$ 65°C, finely dividing the heated pieces at low temp. (< 10°C) or in a frozen state and treating with caustic soda in the presence of a collagen swelling retarder.

The cohesive force of the connective tissue can be decreased without decomposing the collagen molecules.

The acidic soln. is pref. a buffer soln. The finely dividing of the tissue is pref. conducted in a frozen state. The treatment with caustic soda is conducted at 10-20°C for 1-7 days. The collagen swelling retarder includes known sulphates, sulphites or halides.

In an example, 1 kg of defatted ox-hide cut into 10 cm square was dipped in 5 litres of an HCl soln. at pH 3 at room temp. for 24 hrs. The swollen ox-hide pieces were heated at 55°C in a bath for 15 mins., followed by cooling in ice-water. The cooled pieces were neutralised with a 20% caustic soda soln. to pH 7 while gently stirring, followed by standing for 1 hr. and then washing with ice-water for 3 hrs. The ox-hide pieces were frozen at -30°C and pulverised to fine particles of 0.1 mm in dia. while keeping the temp. at ⩽ -5°C. A soln. (4 litres) contg. 2% caustic soda and 20% sodium sulphate was added to the particles (900 g) and maintained at 10°C for 4 days to obtain a sol. dispersion. 26.7.77 as 089531 (3pp140)

UNIC D12 64975R/36 =NL-159-565

Tubular skin for packing foodstuffs eg - sausages

UNION CARBIDE CORP 05.03.69-US-804452

*A92 Q32 +Q31 (15.03.79) *BE-746-922 +A22c-13 B65b-09/10*

Synthetic casings for sausages are packed in folded form into a hollow cylindrical stick which can then be placed onto the sausage machine and the casings drawn out and filled with sausage meat. Each stick is packed into a flexible permeable membrane which is wrapped over the outside and inside wall of the stick.

The membrane holds the stick in compression until it is placed in position onto the sausage machine. The risk of damage during transit is thus minimised and it is possible to moisten the casings without unpacking them since the wrapping is permeable. 5.3.74 as 003174. (7pp1370)

LEME= ★ D12 25200B/13 ★SU-605-589

Heat treatment installation sausage packing mechanism - has pan conveyor for filling individual sections of loading frame

LENGD MEAT IND PROD 03.12.75-SU-195560

(14.04.78) A22c-15 A23b-04/04

Device for packing sausage-like articles for heat treatment, includes a loading mechanism and a frame. Productivity is increased by making the former as a pan-conveyor, installed so that it can move intermittently. A pusher is positioned above the conveyor. The latter comprises a framework with holders mounted cantilever-wise in rows one above the other. These holders can move intermittently upwards and have pusher-ejectors.

These are made up of carriers with vertical supports connected to horizontal crossbeams, the number of which equals the number of rows in the frame. The horizontal crossbeams have projections, the number depending on the number of holders in each row.

Meat brining appts. - with perforated false bottom close under conveyor, with perforated blades for reduced process time

UKR MEAT DAIRY IND 09.08.76-SU-391979

(14.07.78) A23b-04/02

Process time is reduced and yield increased by using appts. comprising a tank with a perforated false bottom under a conveyor, which has perforated blades, and brine recirculation system. The profile of the bottom corresponds to the shape of the conveyor lower run.

Meat pieces are carried through the tank by the blades, the blade perforations ensuring maximum liquid contact. The perforated base and minimum gap between base and conveyor ensures continuous movement of meat pieces and prevents the pieces from being trapped under the blades.

Galushchenko, V.A., Timoshchuk, I.I., Zhirnyi, P.A. et al. Bul. 17/5.5.78. 9.8.76. as 391979(2pp1358)

KLAI= ★ D12 25202B/13 ★SU-605-591

Ice glazing frozen food blocks - by applying water through relatively moving contacting absorbent material for uniform film formation

KLAIPEDA OCEAN FISH 01.08.76-SU-389228

(14.04.78) A23b-04/06

A uniform film of ice is formed on blocks, particularly of fish, by applying water through water-absorbent material in contact with the block surface. A frozen block is brought into surface contact with the absorbent material, e.g., cotton fabric, with relative movement. The material is continuously wetted with water so that a uniform film runs on to the block surface. The thickness of the glaze can be varied by adjusting the relative speed of block and material and the contact time. All sides can be glazed by tilting the block. A uniform and strong glaze is obtained.

Sausage stuffing horn - with deflector to mix sausage meat passing through horn

DEVRO INC 20.10.75-CA-237988

(05.09.78) A22c-11

A sausage stuffing horn comprises an elongate body with an inlet opening at one end and a discharge opening at the other. Between the two openings is a confined channel along which sausage meat flows. A fixed deflecting member is located in the channel spaced inwardly from the discharge opening.

The deflecting member lies at 5-85° (35-55)° to the direction of flow of sausage meat and exchanges the inner portion of the flowing sausage meat with the other portion. Pref. the deflecting member is in the shape of a curved moldboard plowshare.

The stuffing horn is used to insert sausage meat into a casing. The outer fatty portions of the meat emulsion are exchanged with the inner portions of the meat emulsion. This prevents smearing of the meat emulsion during packaging. Also cooking of the resultant sausage does not result in loss of the meat juices and thus a more moist prod. is obtd. 20. 10. 76 as 734226 (5pp295)

CARN- ★ D12 25831B/13 ★US 4112-126

Treatment of disorders caused by over eating - using compsns. contg. soya protein and dietetic fibre
PPN PHARMACOL PHARM 23.06.77-FR-019303
B04 (23.02.79) A61k-35/78 A61k-37/02 C08l

Therapeutic compsns. contg. 20-80% soya protein and 20-80% dietetic fibres are new. These are used for prevention and treatment of disorders caused by overeating such as constipation, obesity, prediabetes, diabetes and metabolic and vascular disorders.

Synergism between the protein and the fibres, and better organoleptic properties are provided.

The fibrous material may be dietetic fibres having a fibrous structure, such as bran or bagasse, or having an amorphous structure such as pectin or guar gum or resin, or a mixt. of these in any proportion. The compositions may further contain Na, Ca, Mg or Fe cations and SO_4 and PO_4 anions, and may be in the form of powders, granules, rusks, biscuits, etc. 23.6.77 as 019303 (17pp520)

OYFA D13 69238Y/39 =GB 1542-802
Fodder additive for ruminants - contains sugar alcohols to increase blood sugar level and milk yield (NL 21.9.77)
FARMOS OY 19.03.76-SF-000746
*C03 (28.03.79) *DT2710-930 A23k-01/16*

Foodstuff which increases the blood sugar level and milk yield of ruminants (cows) comprises ⩾10 wt.% (dry basis) penta- and/or hexahydric sugar alcohol(s).

The sugar alcohols are esp. by-prods. obtd. in xylitol prodn. from plant material and may comprise (dry basis) 5-25% xylitol, 20-35% arabitol, 10-25% mannitol, 5-15% sorbitol, 5-15% dulcitol and 4-10% rhamnitol.

The fodder component may be a by-prod. from a nutrient prodn. process and a glucogenic substance such as propylene glycol may be present. 15.3.77 as 010841 (5pp945).

UYLE- ★ D13 24293B/13 ★GB 1542-838
Treating cows to prevent milk fever - by controlling calcium intake before and after parturition
UNIV LEEDS IND SERV 20.11.74-GB-050362
B06 C03 P14 (28.03.79) A01k-05

Method comprises maintaining the available Ca intake at a low level for ⩾7 days (esp. ⩾4 weeks), ending ⩾1 day (pref. 2-3 days) before parturition, then increasing available Ca intake by 20-100 g/day.

The low Ca level is pref. 20-40 g/day and the high level is pref. maintained for 2 days after parturition. Esp. Ca and P are supplied together at wt. ratio 1:1-2:1, best intakes of the two are about the same.

Esp. the Ca and P are supplied as diCa phosphate and the low level is esp. about 30g/day. Thereafter the intake of both elements is increased to 50-130g each. 20.11.74 as 050362 (2pp1251).

Production of blocks of natural cheese - by submitting a column of curds to differential pressure achieved by pulling vacuum below column
WINCANTON ENG LTD 04.04.75-GB-014002
*P13 (28.03.79) *BE-840-192 A23c-19/02*

Cheese is produced by forming blocks of prepd. cheese curd into a pillar in a chamber, the curd towards the bottom of the pillar being compressed by that above it to press out whey and to effect consolidation; the pillar is lowered, bottom portion is severed to form a block of cheese, and the process continued.

The pillar is urged downwards during the lowering operation by subjecting the top of the pillar to a higher gas pressure than the base. Whey and air are extracted from the chamber. The process avoids difficulties associated with frictional resistance between the pillar and a hollow column in a previous process. 26.3.76 (8pp1379).

Measuring material moisture content in powdered milk processing - in which moisture content initially exhibits wide spatial variation and subsequently is uniformly distributed
BINDICATOR CO 15.09.77-US-833563
R26 (28.03.79) G05d-22/02

Material moisture content in a processing system, in which the material assumes a first state in which the moisture content exhibits wide spatial variation on a short term basis followed by a second state in which the moisture content is uniformly distributed, is controlled by measuring the moisture content in a selected no. of samples when the material is in the first state. An apparent av. value of moisture content in the first state is calculated from these samples. This is treated as an actual

and used to control a drier unit which regulates the moisture content of the material.

The process is controlled on the basis of measurements made on samples taken from the drier output without waiting, e.g. 3-4 hrs., until the ultimate moisture content of the material is known. 14.9.78 as 036891 (6pp).

Instant fried vegetables prepn. - by coating vegetables with alkaline swelling agent, edible oil, flour and water, frying and drying
KANEBO KK 19.07.77-JA-087057
(21.02.79) A23l-01/34

The method comprises (1) combining alkaline swelling agent and edible oil in a coating liq. of flour and water, (2) coating vegetables with the obtd. liq., (3) frying them to distribute the water in them, and (4) drying the fried prods.

By applying the coating liq. contg. alkaline swelling agent, a vivid green colour of vegetables can be maintained when frying and the coating can be well swollen. Instant fried vegetables, which maintain a vivid green colour and can be restored with hot water within 3 mins., can be prepd. The specific heat of the coating liq. is decreased and the frying time can be shortened. Pref. the alkaline swelling agent is sodium bicarbonate in an amt. of 0.05-0.6 w/w% of the flour; the edible oil is used in an amt. of 2-30 w/w% of the flour; the coating liq. is used in an amt. of 0.5-2 times the vegetable wt.; the frying is at 140-190° C until the moisture content is 25-50 esp. 3-45 w/w% and the drying is with hot air at < 100°C until the moisture content is < 13 w/w%. 19.7.77 as 087057 (7pp5)

YAMA/ ★ D13 24712B/13 ★J5 4023-140
Extn. of egg-shell membrane protein used for heavy metal removal - by treating with reductant to break di:sulphide bond, acidifying and sepg. the protein by isoelectric point pptn.
YAMAGUCHI M 23.07.77-JA-087895
(21.02.79) A23j-01/08

Method comprises (a) treating egg shell membrane as it is or after sepg. it from egg shell mechanically with the reducing agent for disulphide bond such as Na_2S, (b) adjusting pH of the obtd. extract to 3.5-5.5 with mineral acid or organic acid and (c) sepg. the solubilised egg shell membrane by isoelectric point pptn.

The extn. is practiced by adding 0.05-10 M reducing agent soln. to egg shell membrane, of which amt. is above 10 times in wt. as egg shell membrane protein, and heating the mixt. at > 90°C at pH 7-13 for 0.5-1 hr. As the reducing agent for disulphide bond, Na_2S, thioglycollic acid, its alkali metal salt, 2-mercaptoethanol, etc. can be used.

Egg shell is ca. 8-11 w/w% on egg and it contains 4-5 w/w% of shell membrane, which is structured of pseudo-keratin, mucin-like protein, etc. The egg shell membrane protein which can bond with heavy metal such as Pb, Cu, Hg, etc. except hexa-valent chrome and iron, can be obtd. Being indigestible, the protein is bonded with heavy metals in digestive organs and can be evacuate as excrements with heavy metals. It can be also used as the removing agent for heavy metalsin food industry. The method can be also used for prepg. the protein showing bonding ability with heavy metals from keratin protein material such as wool, feather, etc. The egg shell discarded is free of proteins and can be used as excellent Ca source for food, feed, etc. 23.7.77 as 087895 (3pp5)

Medicinal food for patients using artificial kidney - is prepd. by mixing milk, eggs, butter, cheese, sugar, flour, soy bean, etc., adding essential aminoacid(s) and baking

NISHIMOTO Y 25.07.77-JA-088971
(21.02.79) A23l-01/34

The medicinal food is prepd. by kneading the mixt. of milk, egg, butter, cheese, sugar, flour, soy bean, fish, potato, fruit, etc. properly, combining essential amino acids such as isoleucine, leucine, lysine, methionine, cystine, phenyl-alanine, tyrosine, threonine, tryptophane valine, glutamine, etc. in the mixt. and baking the obtd. dough in cookies (sic.).

With the medicinal food, the nutrient control of the patients can be practiced easily. Using the food, the patient can ingest essential amino acids in proper proportion. 25.7.77 as 088971 (2pp5)

MITK ★ D13 24910B/13 ★J5 4024-085

Reagent for determn. of l-lysine e.g. in foods etc. - contains L-lysine-alpha-keto-glutaric acid epsilon-transaminase, L-glutamic acid dehydrogenase, coenzyme and electron transfer complex

MITSUI TOATSU CHEM INC 26.07.77-JA-088803
B05 E16 J04 R16 (B04 D16) (23.02.79) G01n-31/22

Reagent comprises L-lysine-α-ketoglutaric acid-ε-transaminase (enzyme I), L-glutamic acid dehydrogenase (enzyme III), coenzyme (pyridoxal-5'-phosphate), electron transferring intermediate (e.g. phenazine methosulphate) and tetrazolium salt (e.g. neotetrazolium chloride or m-nitro-blue tetrazolium chloride, etc.).

L-lysine can be very precisely determined colorimetrically in short time by simple operation even in the presence of other amino acids. The reagent is useful for the determination of L-lysine contained in foods, natural substances, clinical test sample, cultured liquid, etc. In the enzymatic reaction with the reagent, formazan is formed via L-glutamic acid from L- lysine. By determining the absorbance of formazan, the amount of L-lysine in an object to be analysed can be obtained. 26.7.77. as 088803 (5pp50)

MITK ★ D13 25010B/13 ★J5 4024-69

Reagent for L-lysine analysis - contains L-lysine-alpha-keto:glutari acid epsilon-transaminase

MITSUI TOATSU CHEM INC 27.07.77-JA-089347
B04 E16 J04 R16 (B05) (24.02.79) G01n-31/22

L-lysine alone can be precisely determined colorimetrica ly in a short time by a simple operation, even in the pres ence of other amino acids, by using L-lysine-α-ketoglutar ic acid ε -transaminase exhibiting high specificity. The reagent is useful for the determn. of L-lysine contained in protein foods, natural substances, living body samples etc.

The transaminase is obtd. by liq. culture of e.g. Achromobacter liquidum IFO 3084. In the enzymatic reactio using the reagent, the reaction temp. 30-40, pref. 37°C, the time is pref. 40 min. and the pH is 7.5-8.5 pref. 8. The determinable range of L-lysine hydrochloride is 0.05 2 µ moles, in which a linear relationship between the amt of L-lysine and the absorbance holds. α-Ketoglutaric aci of 20 µ moles is pref. added to the reaction liq., with pyr idoxal-5-phosphate as coenzyme. In the enzymatic reaction of L-lysine, Δ'-piperidine-6-carboxylic acid is formed, which has an orange colour (absorption max. 465 nm), in the presence of o-aminobenzaldehyde. This substance is colorimetrically determined for the analysis of L-lysin 27.7.77 as 089347 (4pp50)

KIMI- ★ D13 25016B/13 ★J5 4024-778

Prepn. of feedstuff for fish, etc. - by forming a slurry from waste water, drying, mixing with salt of alginic acid or pectin and reacting with divalent metal salt

KIMITSU KAGAKU KENK 23.07.77-JA-088576
C03 (24.02.79) A23k-01/20

Waste water is treated to give an active slurry which is dehydrated and dried, mixed with water-soluble salt of alginic acid or LM-pectin added dropwise to a soln. of divalent metal salt (except Mg) to allow a reaction to take place to give a gell, and dried. The feedstuff contains nutrient components and can be given to fishes, etc. It may be mixed with other components such a fishmeal, soybean powder, wood powder, flour, starch, vitamins, organic acid, antibiotics, fat, etc.

In an example, waste water from alginic acid extn. is treated to give an active slurry. The slurry is subjected to centrifugation to give a wet slurry, 100 g of which is mixed with 300 cc of 2% sodium alginate soln. The soln. is added dropwise to 1% calcium chloride soln. After standing for 7 mins. a pearl-like gel is sepd. to give 375 g gel granules. The resultant granules are used as feedstuff. 23.7.77 as 088576 (2pp22)

A process is described in which foodstuffs undergo a cooing and heating process. The equipment consists of two compartments, one for heating and the other for cooling divided from each other by means of a partitioning wall. The cooling compartment contains a cooling medium into which the treated material is immersed on a conveyor. The vapour from the cooling medium is drawn through a condensor and returned to the cooling compartment.

A second conveyor running through the partition wall and passes from the first conveyor and passes it into the heating compartment. The cooling medium which evaporates from the foodstuff during the heating cycle is drawn off through a second condensor and is then returned to the cooling compartment. 12.11.73 as 015441. (5pp1370)

Liquid desorption installation e.g. for milk - has a vacuum chamber having ejector extraction pipe and by/pass pipe fitted with cooling jacket
PROVISION MACH RES 13.01.76-SU-314256
J01 P13 (06.04.78) A01j-11/04 B01d-19

Installation for liquids desorption, e.g. milk, comprises a vacuum chamber, inside which is a liquid distributor and float valve. An extraction pipe for the desorbed liquid is located in the centre of the bottom of the chamber. A condenser, vacuum pump and centrifugal pump for pumping out the final product, linked to the extraction pipe, are included. Optimum pumping-out conditions, at temp. close to the b.p. of the material being treated are maintained, and productivity is increased by making the extraction pipe as an ejector. The ejector has a by-pass pipe connected to the pressure pipe of the centifugal pump, and the ejector nozzle. One part of the pipeline is fitted with a cooling jacket, and the float valve is connected to the by-pass pipe on the section following the cooling jacket.

Nutritionally balanced single food compsn. - suitable for patients with abnormal catabolic states

BEATRICE FOODS CO 21.07.76-US-707247

(05.09.78) A23c-21

Nutritionally balanced single food compsn. for oral ingestion, giving low residues and diminished stooling is claimed.

Compsn. contains (a) 8-27 wt.% water soluble undenatured ultra-filtration whey protein; (b) 5-20 wt.% medium chain triglycerides contg. mainly 6-10C in the fatty acid chain; (c) 50-70 wt.% carbohydrate, which is corn syrup solids, trisaccharides, tetrasaccharides, penta-saccharides, hexasaccharides, dextrose fructose, sucrose, maltose, oligosaccharides and/or higher saccharides; and (d) 0.1-5 wt.% food grade emulsifier, the compsn. contg. 1-3 cals per cc.

The prod. is esp. for patients e.g. with severe burns, having abnormal catabolic states, and requiring high calorie intakes. The compsn. may be low viscosity liquids for drip-feeding, sipping, etc. or higher viscosity for simulated foods e.g. custards, etc. and may be formulated with low osmolarity to avoid 'dumping' 21.7.76 as 707247 (8pp955)

DRIS- ★ D13 25829B/13 ★US 4112-124

Sterile food packaging in flexible envelope - filled with inert gas and irradiated with UV light

DRISAN PACKAGING LT 26.04.71-US-137553

Q31 (05.09.78) B65b-55/16

The food prod. is packaged in a sterile condition by initially placing a substantially sterile product in a flexible envelope. The envelope is then transferred to an appts. in which ambient air is removed from the envelope by a curtain of inert gas which collapses the envelope onto the food. The envelope is filled with a dry, sterile, inert gas and is then sealed. The walls of the envelope are opaque to visible light yet are transparent to UV radiation which is directed onto the package while inside the appts. This UV light kills bacteria on the surface of the prod.

Food is packaged in a sterile condition in the envelope and may be maintained at refrigeration temperatures (36°F) for periods of several months without deterioration. The method overcomes the cell destruction associated with preservation by freezing. 26.4.71 as 137553 (15pp295)

(05.09.78) A21d-10 A23l-01/22

Semi-moist, semi-soft particles for carrying food flavour and colour comprises 5-30% vegetable or dairy protein, 0-50% dextrose, 0-50% sucrose, 5-70% gelatinised starch and 5-40% vegetable fat of m.pt. 100°F or less, and an effective amt. of colour and flavour. The compsn. contains at least 5% of dextrose or sucrose, and 5-30% water, the water activity being 0.85 or less.

The prod. is esp. intended to imitate fruit etc. in baked goods e.g. blueberries in muffins. 15.2.77 as 768725 (6pp955)

JOHM ★ D13 25834B/13 ★US 4112-129
Compsn. for reducing build-up of free fatty acids in cooking oil - comprises diatomite, and synthetic hydrated calcium and magnesium silicates
JOHNS MANVILLE CORP 14.09.77-US-833215
(05.09.78) A23d-05/02 C09f-05/10

Compsn. for controlling free fatty acids and colour in cooking oils comprises (by wt.) 47-59 pts. diatomite, 28-36 pts. synthetic Ca silicate hydrate (I) and 12-24 pts. synthetic Mg silicate hydrate (II). Flux-calcined diatomite is used of particle size distribution 20-30% $<$ 20 μ and 40-60% $<$ 30 μ and of dry bulk density 10-14 lb/ft^3.

(I) is formed by hydrothermal reaction of CaO and SiO_2 has $CaO:SiO_2$ wt. ratio 1:(1.5-2.5), has dry bulk density 6-10 lb/ft^3, a particle size distribution of $\nless$95% - 35 mesh and 8% + 325 mesh, and a permeability of 0.35-0.70 darcies. (II) is formed by hydrothermal reaction of MgO and SiO_2, has $MgO:SiO_2$ wt. ratio 1(3.5-5.5), has a dry bulk density 12-15 lb/ft^3, particle size distribution of $\nless$ 95% - 325 mesh and a surface area of 150-200 m^2/g.

Components act synergistically and impart no off-taste to the food. Relatively fast flow rates are obtd. permitting rapid filtration of large amts. of oil and oil service life can be extended by $\geqslant$50%. Useful for treating hot cooking oils in conventional filtration units of fast food outlets and restaurants. 14.9.77 as 833215 (6pp949)

Butter substitutes and margerine type food prods. - mixing fats and aq. medium of specified viscosity at 15 to 45 degrees centigrade
SOC PROD NESTLE SA 31.07.75-CH-009984
*(05.09.78) *BE-843-798 A23d-03/02*

Prodn. of an edible prod. of the butter or margarine type comprises thoroughly mixing at 20-35°C, a medium (I) comprising fats, and an aq. medium having a viscosity of 2000-20000 cpds., as measured at 20-30°C. The mixing temp. is such that the fats exist in neither a partially crystallised state nor in the formation of a water-in-oil emulsion having a fat content of 35-90%. Pref. (I) is butter.

No phase invertion of oil-in-water emulsion to a water-in-oil emulsion is required. 30.7.76 as 710223 (4pp982)

COKE ★ D13 25835B/13 ★US 4112-130
Spray drying orange juice slurry - contg. food-grade water-dispersible or soluble drying aid, under specified parameters
COCA-COLA CO 14.10.75-US-621716
(05.09.78) A23l-02/10

Free flowing orange juice powder of improved flavour is obtd. by concurrently spray drying an aq. slurry comprising 51-65% solids, 51-85% of which are orange juice solids, the balance being a food grade water-dispersible or -soluble drying acid. Spray drying is to moisture content $<$ 4% by passing the slurry through high pressure spray nozzle(s), at inlet air temp. 220-300°F, outlet air temp. 145-205°F and nozzle pressure 3000-500 psig.

The interior walls of the drying chamber are held at $<$ sticking pt. of the powder, and spray drying angle and drying chamber size are chosen in conjunction with nozzle pressure to minimise buildup of undried powder on the walls. 14.10.75 as 621716 (7pp949)

KRFT ★ D13 25836B/13 ★US 4112-131
Continuous in/line process cheese prodn. - with direct steam injection in pressurised cooking zone
KRAFT INC 09.02.77-US-766853 (02.09.75-US-609520)
(05.09.78) A23c-19

Process cheese mfr. comprises blending the starting materials at ambient temp. then passing under pressure through heating and mixing zones to give a homogeneous molten cheese of 42-75% moisture. The mixing zone is at 5-60 psig and 165-300°F. The cheese is then transferred to a zone at 150-210°F/3-15 psia ($>$ 4 psia below that in mixing zone).

The heating zone comprises a steam injection conduit, with many steam holes of dia. 0.02-0.07 inches, inside a housing so as to define an annular passage through which the cheese flows. In the reduced pressure zone moisture content is reduced by 2-25 wt.% (on the wt. of moisture in the melt) to give a cooled prod. of 40-70% moisture.

The prod. has good body texture and flavour. 9.2.77 as 766853 (8pp1251)

FARM- ★ D13 25837B/13 ★US 4112-133
Liq. smoke compsn. contg. added food acid and solubiliser - to prevent deposition of solids, used for treating meat, fish cheese etc.
FAR-MAR-CO INC 29.09.76-US-727651
A97 (05.09.78) A23l-01/22

Liq. smoke compsn. is made by mixing (i) a natural smoke soln. contg. acids, phenols, and carbonyls, (ii) a food-grade acidulant; and (iii) a food-grade solubilizer.

Component (ii) is $\geqslant$2 wt.% for a phenol concn. in (i) of 1.5-2 g/l, plus 0.5% for every additional 0.5 g/l phenol, or less 0.5% for every 0.5 g/l phenol below this range. Component (iii) is $\geqslant$4 wt.% for a carbonyl concn. in (i) of 3-3.5 g/l, plus 0.5% for every additional 0.5 g/l, or less 0.5% for every 0.5 g/l carbonyl below this range.

(iii) are (polyoxyethylene) sorbitan fatty cpds., polyoxy-ethylene fatty cpds. or polyoxyethylene glycols of mol. wt. $\geqslant$ 400 or their mixts. 'Fatty cpds.' are opt. unsatd. mono-acids or mono-alcohols, or their mono-esters.

Components (ii) and (iii) inhibit deposition of solids during storage and use, so the solns. give superior flavour and colour. 29.9.76 as 727651 (8pp1251)

Oven door handle - arranged in cool parts for safe handling
ADELBERGER F 08.09.77-DT-740462
Q74 (22.03.79) A21b-03/02 F24c-15

The door handle for the swing-down door of an oven with a double-glazed insert is a strip extending over the width of the door and arranged in a door recess at the top away from hot parts. The handle is fitted with a torsion spring which returns it in the closed position in the recess, when turned less than 90°.

When turned over 90°, the spring urges it into a position where it stands out beyond the door. This prevents injuries to the hand by burning. 8.9.77 as 740462. (5pp39)

PICO- ★ D14 24171B/13 ★DT 2837-434
Safety valve for pressure cookers - comprises counterbalanced relief valve with activating knob on top
PICOUT & CIE SA 16.09.77-FR-028008
Q68 (22.03.79) B01j-03/04 F16p-03

Safety value for pressure cookers consists of a counterbalanced relief valve having a ball held in its seat by a weight. Above this is an actuating knob. The valve can be lodged open by pulling up the knob and rotating it.

The knob has a hollow short shaft which slides around a short shaft extending from the top of the weight. A bar runs through the outer shaft and a slot in the inner one. When the knob is pulled, the bar lifts the weight and opens the valve. If the knob is pressed, it does not exert extra pressure on the valve seat because of the slot, and thus the valve always relieves at the set pressure.

Used on pressure cookers and autoclaves esp. for rapid cooking of food. The problem with conventional values is that if pressure is applied to the knob on top, this increases the pressure inside the vessel and can damage it, also causing accidents and injury to the person using it. The valve described cannot be held down in this way. 28.8.78 as 837434. (14pp1053)

ALFA ★ D14 24283B/13 ★FR 2395-477
Drying plant for pulverulent prods. e.g. for dried milk powder prodn. - in which preheated hot air is circulated and controlled so that its discharge temp. is practically constant

Heat-sensitive materials sublimation dryer - has ported heating plates with perpendicular inserts
TEKHRYBPROM 07.04.75-SU-129481 (07.04.75-SU-158501)
B07 J08 Q76 (12.04.78) F26b-05/06

Intensified sublimation drying of heat-sensitive materials in food or pharmaceutical ind. is ensured by heating plates with through ports and tubular inserts fitted at right angles to the plate plane. Exchangeable inserts are fitted between the plates, and the sublimation chamber has ribs at the top and bottom. The ribs form circulation channels for the heating medium with connection to the cavity of the plates, and contg. heating elements.

Shields are provided between the evaporator-freezer and the set of heating plates to reduce the effect of freezer radiation on the dried material. The heating plates with their perpendicular inserts give rise to heat carrier flow turbulisation, as well as provide a passage for the vapour removed from the dried material.

Animal feeds mixer - has additional screw chambers concentric to main chambers, and diametrically opposed, round central mixing chamber
DUNAISKII SH P 01.07.76-SU-378539
P41 (13.04.78) B02c-18/36

The mixer comprises screw chamber with fixed and free cutters and a discharge system. To complete the system it is now supplemented by a mixing chamber and additional screw chambers arranged diametrically opposite round the mixing chamber.

Each screw chamber is additionally fitted with a concentric screw space. The screw chambers each grind an chop to the required size, handling one contituent of the feed only, and thus discharge these into the centrally arranged vertical mixing chamber for further homogenisin prior to the downward removal to pack or sack etc.

Forced air food dryer - comprising shelved cabinet with air flo following tortuous path to dry food on all sides
BEMROSE H F 30.08.76-US-718910
(05.09.78) A23b-04/04

A forced air drier comprises a cabinet having a door in one wall, and supports for vertically spaced, food suppor ting trays. Each tray includes an upper food support fora minous sheet and a lower reflective sheet.

Alternating opposite sides of the trays include upstand ing air flow passages joining the spaces between adjacent trays and into which the spaces between the upper and lov er sheets of each tray open. The spaces between the upp er and lower sheets of each tray, the spaces between adja cent trays and the passages define a tortuous air passage way through the cabinet and around the trays. Heated air is forced through the tortuous passageway.

The appts. is used to dry e.g. fruit. The drier expos the food to be dried to heated air on all sides simultaneou ly. 30.8.76 as 718910 (6pp295)

Sectioning cored fruit positioned on stationary spindle - b contacting with rotating blades extending radially to spindle
ALTMAN J E 22.04.76-US-679381
(05.09.78) A23n-04

A precored fruit is advanced along a stationary spindle whose dia. is less than that of the core cavity. Circular saws are rotated and lie in planes which are parallel to the spindle. Typically, the blades extend radially from the spindle and the innermost portion of each blade is received in a slot in the spindle. The blades are driven from a single power source which drives a series of axle by a system of bevel gears.

The appts. cuts a cored fruit e.g. an orange, into seg ments. The segmenting procedure does not distort the core region of the fruit. 22.4.76 as 679381 (7pp295)

Reverse osmosis kit for producing potable water from sea water - comprises semipermeable membrane defining collection chamber which is connected to storage vessel
IZARD J A 13.08.75-CA-233376
A88 J01 (20.03.79) B01d-13

Appts. for prodn. of potable water from sea water comprises a support which mounts a semipermeable membrane and permit potable water to permeate through at depths of at least 130 fathoms in the sea into a collecting chamber. A water storage chamber is connected to the collecting chamber via a pressure relief and check valve. The valve defines a one way path for the potable water and prevents any backpressure, created during raising of the appts. from reaching and damaging the semi-permeable membrane. Pref. the membrane is of cellulose diacetate-cellulose triacetal.

For emergency use in lifeboats, the appts. eliminates the use of manual pumps to provide the pressure necessary to carry out a reverse osmosis process of sea water. 13.8.75 as 233376 (12pp1044)

Purificn. of aq. alkaline waste contg. nitrogen oxide - by addn. of oxidising agent to waste, dilution with water and addn. of pickling effluent contg. nitric acid

SEISUI KOGYO KK 20.07.77-JA-088203

E36 J01 M12 (21.02.79) C02c-05/04

A conc. NO_x-contg. aq. alkali waste, e.g. produced by washing a waste gas contg. harmful oxidising gas, e.g. NO_x and COD components, etc. with a conc. alkali soln., e.g. NaOH soln. and Na_2S soln. etc., is purified. The process is carried out economically and accurately without releasing harmful oxidising gas into the atmosphere by previously adding under agitation a portion of an oxidising agent necessary for the oxidn. reactionof the aq. waste, e.g $KMnO_4$ soln. and H_2O_2 soln. etc., to the aq. alkali waste to be treated. This is followed by dilution with H_2O.

The remaining portion of the oxidising agent is added to a pH-adjusting acidic liquor to be added to the waste water, e.g. an acidic HNO_3-contg. pickling effluent etc. Subsequently, the oxidising agent-added alkali and acid aq. waste are mixed.

The harmful oxidising components-contg. gas is, e.g., produced by pickling the surfaces of a metal article with an HNO_3 soln. 20. 7. 77 as 088203 (-pp34)

YAWH ★ D15 24668B/13 ★J5 4023-070

Hydrogen sulphide removal from acidic liquor contg. ammonium sulphate - by treatment with ammonium persulphate and forming reaction prods. in form of colloid

NIPPON STEEL CHEM KK 22.07.77-JA-087307

C04 E36 J01 (E35) (21.02.79) C01c-02/24 C02c-05/04

Removal of hydrogen sulphide from mother liquor of ammonium sulphate acidified with sulphuric acid comprises adding ammonium persulphate to the mother liquor. Ammonia is removed from the gas-stripped aq. waste contg. ammonia and hydrogen sulphide.

Persulphate does not self-decompose in aq. soln. acidified with sulphuric acid at relatively high temp. therefore it acts effectively as oxidising agent. Since reaction prods. are ammonium sulphate, sulphuric acid and sulphur dispersed in the form of colloid, and these are components contained in mother liquor of ammonium sulphate the treatment is simple.

In an example, 0.5% ammonium persulphate is added to aq. soln. consisting of 30% ammonium sulphate satd. with hydrogen sulphide of 3% free sulphuric acid at 50°C. This soln. was allowed to stand at 50°C for 5 hrs. with occasional stirring. The smell of hydrogen sulphide almost vanished and a slight white cloud appeared in the soln. 22. 7. 77 as 087307 (2pp86)

EBAI ★ D15 24669B/13 ★J5 4023-071
Treatment of waste soln. contg. hydrazine - by adding active carbon and opt. an iron salt to slightly alkaline waste soln. and aerating the soln.
EBARA INFILCO KK 21.07.77-JA-087967
E36 J01 (21.02.79) C02c-05/04

Waste soln. contg. hydrazine is treated by adding active carbon and opt. iron salt to the waste soln. at pH 8 and aerating. The amt. of active carbon used is 0.05-0.5 wt. % and the iron salt added gives a Fe ion concn. of 100-1000 ppm.

The operation is simple, and hydrazine in soln. may be economically oxidised using simple appts. and may be removed. The treated soln. has pH value corresp. to discharging standard. Sludge contg. active carbon and iron hydroxide formed after treated, may be repeatedly used.

In an example, $FeSO_4$ is added to 50 l of aq. soln. contg. 500 ppm of hydrazine so that the concn. of Fe ion becomes 100 ppm and after stirring for about 5 min., the soln. is adjusted to pH 10 with NaOH, and 0.2 wt. % of powdered active carbon is added. The soln. is aerated at flow rate of 1.5 l/min. for 8 hrs. The resulting supernatant is sepd. after being allowed to stand for about 2 hrs. 21.7.77 as 087967 (4pp96)

MEIS- ★ D15 24674B/13 ★J5 4023-078
Electrolytic cell for appts. for mfg. medical material - includes ion exchange membrane between two gaskets with anode and cathode outside the gaskets
MEISEI KK 25.07.77-JA-088347
E36 J03 (21.02.79) A23l-01 C25b-09

Ion-exchange membrane is placed between gaskets. A cathode chamber and anode chamber are formed by arranging cathode on one position and anode on other position outside said gasket and spreading net within the cathode and anode chamber. The flow rate of drinking water in the cathode chamber and anode chamber is so kept constant at > 10 cm/s and electrolysis is carried out with controlling current to a constant value most suitable for forming alkali ion water.

The structure of electrolytic cell is extremely simple and inexpensive: Homogeneous alkali ion water may be continuously obtd. 25.7.77 as 088347 (4pp96)

MITR ★ D15 24676B/13 ★J5 4023-080
Washing process for ultra-filtration or reverse osmosis membrane - includes treatment with ethylene-di:amine tetra:acetic acid and sodium borate in combination with physical treatment
MITSUBISHI RAYON KK (MITS-) 25.07.77-JA-088927
A88 J01 (A14) (21.02.79) B01d-13 B01d-31

Semi-peremeable membrane, esp. made of an acrylonitrile copolymer, is suitable for use as ultra-filtration membrane or reverse osmosis membrane in the treatment of waters. The membrane is washed with an aq. soln. contg. 0.05-0.5 wt. % ethylenediaminetetraacetic acid and 0.1-1 wt. % of sodium perborate to remove dirt covering the surface or the inner part of the membrane. In this way its water permeability is easily recovered.

This chemical washing treatment produces the best results when it is carried-out in combination with a physical washing treatment. The physical washing treatment is e.g. carried-out by charging sponge balls into a tubular semi-permeable membrane (the dia. of the sponge balls being larger than the inner dia. of the tube). The sponge balls are transferred by hydropressure from one end to he opposite end so as to remove dirt adhering to the inner urface of the tube, without any damage to it. 25.7.77 as 088927 (4pp34)

he organic sludge contg. much water is contained in a losed vessel, pressurised, heated and expanded into a liq. he liq. is then heated until it has dewatered and dried. eam and condensed water produced in the process are sed for preheating the organic sludge. Pref. the sludge xpanding tank comprises a stirrer, on the top of which blades are mounted. The tank is followed by a sluge sepa ator through a pipe. 27.7.77 as 089248 (7pp26)

SHIE ★ D15 24968B/13 ★J5 4024-28
Regenerator for iron cpds. removal from ion exchange resin comprises mainly poly:carboxylic acid (salt)
SHINETSU CHEM IND KK 26.07.77-JA-088849
E19 (23.02.79) B01j-01/09 C09k-03

Regenerator for ion exchange resin capable of removing Fe cpds. present in water, esp. for water-softening ion exchange resins, contains mainly aminopolycarboxylic acid or its water-soluble salt (excepting EDTA), e.g. ammonium salt or alkali metal salts, or their combinations.

Pref. the water-soluble salts of aminopolycarboxylic acid includes nitrilotriacetic acid, hydroxyethylethylenediaminetriacetic acid, cyclohexanediaminetetraacetic acid diethylenetriaminepentaacetic acid, triethylenetetraaminehexaacetic acid, iminodiacetic acid, ethylenediamineorthohydroxyphenyl acetic acid and in ammonium and alkali metal salts.

The regenerator is capable of effectively removing iron cpds., e.g., iron hydroxide, including ionised iron cpds. adhered to ion exchange resins. 26.7.77 as 088849 (3pp)

HITB ★ D15 24971B/13 ★J5 4024-286
Removal of heavy metals from water - using vinyl copolymer material contg. phosphoric acid salt e.g. calcium phosphate
HITACHI CHEMICAL KK 26.07.77-JA-089944
A91 E33 J01 (23.02.79) B01d-15 C22b-03

Heavy metals arrester, capable of capturing harmful heav metals present in water, or waste water, e.g. those discharged from various factories, mining, etc. comprises small pieces of a monovinyl monomer-polyvinyl monomer copolymer contg. a phosphoric acid salt which is hard to dissolve in water, e.g., Ca phosphate, Mg phosphate etc.

The monovinyl monomer used includes methylacrylate, ethylacrylate, propylacrylate, isopropylacrylate, etc. and the esters of these, styrene, vinyltoluene, vinylnaphthalene, etc., and the polyvinyl monomer used includes divinylbenzene, divinylpyridine, divinyltoluene, etc. glycols, glycerol, divinylketone, etc.

The arrester is capable of efficiently arresting heavy metals, e.g., Cd, Pb, Zn, Fe, Cu, etc. and the organic and inorganic salts of these at pH near neutral, and thus the heavy metals content in water can be reduced to less than the effluent standard. 26.7.77 as 089944 (4pp117)

DORI- ★ D15 24990B/13 ★J5 4024-455
Biological treatment of waste water by fluid contacting method - comprises treating waste water with microorganisms adhered to surfaces and cavities of contacting substances
DORIKO KK 27.07.77-JA-090013
(23.02.79) C02c-01/02

Waste water is treated by microorganisms adhered to the cavities and surfaces of contacting substances moving in the waste water. Pref. the contacting substance used is an anticorrosive, water resistant synthetic resin cylinders with a specific density of 0.8-1.5 but any other shaped substance, e.g., approx. cubic form having three crossing perforated holes or recessed portions on each side may be used.

Waste water can be efficiently treated by the joint action of an activated sludge type purification because an aerobic biological action acts on waste water inside the cavity of the contacting substance and an anaerobic biological action acts on waste water outside the cavity. The microorganisms are securely adhered to the contacting substance in a fixed amt. during the course of treatment operation, thus ensuring a constant waste water treatment capability. In addn., the amt. of sludge generated is small, and the amt. of the contacting substances used in the treatment tank can be easily controlled, thus reducing costs. 27.7.77 as 090013 (5pp117)

TORA ★ D15 24991B/13 ★J5 4024-456
Treating polluted water rich in BOD content - by passing into biological membrane oxidn. tank, sepg. sludge and partly recycling sepd. water
TORAY INDS INC 25.07.77-JA-088295
(23.02.79) C02c-01/02

Method comprises (1) introducing polluted water into a biological membrane-oxidn. tank; (2) subjecting treated water to a sludge sepn. means, e.g., inclined screen, rotary perforated drum, etc. to separate a part or the large part of sludge; and (3) partly recycling sepd. water to the biological membrane-oxidn. tank, the polluted water feed line, or the polluted water storage tank, where the amt. of the sepd. water to be recycled is pref. approx. ten times as much as the polluted water to be treated at the start of operation and then reduced to 2 to 3 times after the biological membrane is stabilised.

Method is capable of constantly treating BOD-rich polluted water in a very short time to an extent that the sludge content of the treated water can be ignored. 25.7.77 as 088295 (4pp117)

UBEI ★ D15 24992B/13 ★J5 4024-457

Organic sludge liquefaction process - comprising pressurising heated sludge then suddenly releasing the pressure

UBE INDUSTRIES KK 27.07.77-JA-089249

(23.02.79) C02c-03

In a swelling treatment method for organic sludge, e.g. excess sludge generated in the treatment of organics-rich waste water, e.g. factory effluent, sewage, etc., the sludge is liquefied by driving out moisture contained in the cell membranes of the sludge by heating, pressurising, and sudden releasing it in a closed system. The sludge is pumped to a heat exchanger to heat it to 95°C. The heated sludge is introduced into a sludge swelling treatment tank where it is heated at 160°C by steam for 30 min. to 1 hr. and at the same time pressurised at 5 kg/cm^{2}G, and then the treated sludge is instantaneously released towards a sludge separator through a sludge feed pipe.

Method, which is capable of completely liquefying the organic sludge, can serve as pretreatment of sludge for dehydration and drying. 27.7.77 as 089249 (6pp117)

NISO- ★ D15 24993B/13 ★J5 4024-458

Treatment of waste water contg. cellulose or starch - with inorganic high polymer coagulant, e.g. aluminium poly:sulphate

NIHON SOLID KK 26.07.77-JA-089607

F09 (D17) (23.02.79) C02c-05/02

Treatment of waste water contg. cellulose or starch, e.g., kraft pulp mill waste water, sulphite pulp waste water, bleaching waste water, ground wood pulp waste water, semichemical pulp waste water, paper mill waste water, starch-mfg. factory waste water, etc., is described. The waste water is first regulated to pH 3.0 to 5.0 using inorganic acid or organic acid, pref. a metal-contg. acid soln., e.g., the waste acid soln. discharged from metal surface-treatment factory including alumite edging waste water, and then treated with an inorganic high polymer coagulant. Pref. the inorganic high polymer coagulant used includes aluminium polysulphate, aluminium polychloride, aluminium polyoxide, iron polychloride, iron polysulphate, etc.

Method is highly effective for removing BOD and COD contaminants, i.e., 600 to 1000 ppm cellulose or starch can be reduced to 20 ppm, thus obviating the need for biological treatment. 26.7.77 as 089607 (2pp117)

Reaction and decantation treatment plant for waste water - has three times the capacity of similar size plants
DEGREMONT SA 24.03.76-FR-008442
*(05.09.78) *BE-852-754 C02b-01/22 +B01d-21/16*

Appts. for treating water comprises a single tank divided into reaction and decantation zones; the input water enters the reaction zone. A pump turbulently mixes the liquid, sludge and precipitation reagents in the reaction zone and draws the mixture upwards through a central passage at a rage which is several times that of the entry flow. Portion of the mixture is recycled to increase turbulence in the chamber and the remainder passes to the decantation zone at uniform flow rate to give even distribution. The purified water rises and is collected; the sludge settles and is returned by scrapers to the reaction chamber and thus maintains the necessary concn.; excess sludge is discharged from the base of the reaction chamber.

Flocculation and/or crystalline precipitation type water treatments are facilitated. 2. 3. 77 as 773555 (12pp1364)

Sludge digester with updraught tube - into which primary sludge is driven by gas introduced into sludge flow
FAIR J H 17.03.77-US-778793 (11.12.75-US-639756)
(05.09.78) C02c-03

Sludge is digested in a tank which includes an open ended updraught tube. Partially digested sludge flows upwardly through the tube. Prim. sludge is brought to the tank through a first conduit which is connected to a second conduit just externally of the tank. The second conduit extends through the tank wall. A third conduit is connected to the second conduit just externally of the tank. A compressed gas is introduced through the third conduit and this forces the prim. sludge through the second conduit and into and upwardly inclined conduit connected to the second conduit within the tank. The upper end of the inclined conduit is connected to the updraught tube near its upper end. The flow of gas and sludge effects a circulation of the materials within the digester tank.

The digester tank may be used for either aerobic or an-aerobic digestion of sewage. The primary sludge is mixed in a confined area with some of the digested sludge prior to release in the tank. This ensures seeding. 17. 3. 77 as 778793 (6pp295)

Method of oxygenating liquid - by producing pressurised liquid stream in which air is entrained
HOUDAILLE INDS INC 26.07.73-US-382650 (17.04.70-US-029565)
F09 J02 (05.09.78) B01f-03/04

A body of liquid is oxygenated by producing a pressurized liquid stream which is directed into a first enclosed axial flow path having a converging section in the direction of flow to inrease the velocity of the liquid. The high velocity stream is discharged through an outlet horizontally into an enclosed mixing chamber. A stream of pressurized air is introduced into the mixing chamber so that air becomes entrained in the liquid.

The liquid and entrained air are directed into a second enclosed frusto conical axial flow path of constantly decreasing cross-section axially aligned with the first flow path. The liquid and air mixture are discharged horizontally through an outlet which is located in the body of water below its surface. The outlet is aligned with and has a greater area than the outlet of the first flow path.

The apparatus is used to add gas to a liquid e.g. air to sewage, chlorine to water in a water treatment plant, or chlorine to pulp-stock in paper making. 26.7.73 as 382650 (+30.10.72-US-302355) (9pp295)

*J02 +P14 P42 (D16) (05.09.78) *DT2646-742 +C02d-01/04*

Appts. for generating bubbles in liquid comprises a spouting nozzle to supply a pressurised liquid stream to impinge upon an impact disperser mounted above the nozzle outlet. A dispersion stream of liquid is directed into the liquid zone surrounding the disperser; above the disperser a port supplies gas which is dragged into the liquid dispersion tream and thus converted into fine bubbles.

Good gas-liquid contact or agitation mixing is provided. 27.9.76 as 727275 (15pp1364)

LING- D15 27638W/17 =US 4112-033
Utilisation of sewage sludge - by automatic mixing with clay and conversion into bricks
LINGL CORP (LING/) 17.07.73-DT-336267
*L02 (05.09.78) *DT2336-267 C04b-33/32 +C04b-35/64*

Bricks are made from sewage sludge containing environmentally harmful and/or toxic substances by automaticall mixing with clay, extruding and forming bricks, drying i dryer, and firing in a kiln to give products free from odo rs or harmful materials.

Dryer exhaust air is cented into the kiln as combustio air so that all aromatic compounds in the exhaust air are destroyed. The sludge pref. has a moisture content of 50% or less and comprises 30-50% of the mixture. The mixture may be stored before extrusion, and used oil ma be added during mixing to reduce odour and assist in firin the kiln. 10.6.74 as 478038 (5pp1358)

FINL/ ★ D15 25900B/13 ★WP 7900-15
Elevating nutrient-rich ocean water from aphotic to photic zone following partial desalination in aphotic zone and dispersing les dense desalinated water
FINLEY W T 07.08.78-US-931675 (16.09.77-US-833939)
(22.03.79) B01d-13 B01d-31 C02b-01/82
D/S: N(BR, GB) + E(FR).

The concn. of nutrients in the water of the photic zone of the ocean is increased by dispersing partially desalinated nutrient-rich water in the zone which originated from the aphotic zone. Nutrient-rich seawater is introduced into a desalination appts., e.g. an electro-dialyser, in the aphoti zone. The partially desalinated water becomes less dens than that in the aphotic zone and is conducted to the photi zone by differential density effects.

Method is provided for enrichment of photic zone of th ocean to increase the fertility and thus increase the supply of harvestable food fish.

Water from the aphotic zone can be desalinated in situ at 100 to 200 metres beneath the ocean surface. It is not necessary to provide a power source from the surface. The partially desalinated water rises naturally upwards into the photic zone with fresh nutrients from the deep aphotic zone.

21.8.78 as US0067 (10pp1044).

The materials to be extd. and extn. liq., esp. alcohol and-/or water, in liq.:solids ratio 4:1 to 10:1, are exposed 10-100 mins. at room temp., to ultrasonic energy at frequency 20-40 kHz and having acoustic power 10-100 watt. The vessel used may contain fixed or moving vibrators. The extn. liq. also acts as ultrasonic energy transfer medium.

Plant- and drug-extracts, esp. for spirits industry, e.g. liqueur- and vermouth-prodn., are obtd. more quickly, in higher yields, approaching quantitative yields, and without lowering prod. quality, than by standard processes, e.g. maceration, digestion, percolation, or solvent extn. Yield increases can be further increased by raising liq.: solids ratio. 22.8.78 as 836676. (11pp200)

Antifungal compsns. contg. fungal cell-lytic enzymes - extracte from Coprinus or Lycoperdon spp., for treatment of fungal infection
SEARLE G D & CO 11.06.75-GB-025000
*B04 C03 (28.03.79) *US4062-941 A61k-37/54 + C07g-07/02*

A pharmaceutical compsn. comprises one or more cell-lytic enzymes from Coprinus or Lycoperdon genera fungi and an acceptable solvent carrier, and/or an anti-mycotic agent. Pref. the enzymes are extracted from C. comatus or L.pyriforme, and the anti-mycotic agent is amphotericin-B, nystatin or griseofulvin.

The compsn. is used to treat fungal infections in non-human animals, the enzymes degrading and weakening fungal cell walls so that conventional anti-mycotic agents are far more effective. The compsn. is partic. useful in treating infections by opportunistic fungi such as Aspergillus fumigatus and Candida albicans, and is also useful for treating Trichophyton mentagrophytes infections. 10.6.76 (9pp990).

Antibiotic AM-2282 obtd. by culturing Streptomyces - has antifungal hypertensive, anti-oedema and antiulcer activity
KITASATO RES INST 11.12.76-JA-148299
*B04 C03 (28.03.79) *DT2754-326 C12d-09/16*

Novel antibiotics (AM-2282) have a molecular formula $C_{28}H_{26}N_4O_3$, specific rotation $[\alpha]_D^{25}$ = 35.0 (c = 1.0 in MeOH), given UV and IR spectra, positive reaction to Dragendorff, Molisch, Rydon-Smith and ninhydrin tests and negative reaction to Beilstein, $FeCl_3$ and aniline phthalate tests. They are soluble in DMSO and DMF, sparingly soluble in $CHCl_3$, EtOAc, n-BuOAc and MeOH, and insol. in petroleum ether, n-hexane and water.

They are active against yeasts and fungi. They are prepd. by culturing Streptomyces microorganisms, esp. S. staurosporeus. 30.11.77 as 049874 (11pp974).

AJIN D16 46789A/26 =GB 1543-09
Amino acid bio:assay microbe preservative - comprising sodium arginate soln., allows ready utilisation of microbe
AJINOMOTO KK 28.10.76-JA-129843
*+R16 (28.03.79) *J53056-380 C12k-01/08 + G01n-21/22*

A dried lactic acid bacteria compsn. is prepd. contg. lactic acid bacteria and an alginate in the absence of amino-acid and vitamin. Pref. alginate is sodium alginate. Prepn. is by freeze-drying method.

Microbioassays of bacteria are made by inoculating oneloopful of bacteria maintained by passage at 2 weeks' intervals into a preincubation medium and then incubated at 37°C for 16-20 hrs. Bacteria are then washed and absorbance measured. Definite vols. of culture are dispersed in ampoules, lyophilised, sealed and then stored at set temps.. The assay is repeated on freeze-dried cultures after storage for relative activity.

Microbioassay means used are neither sophisticated nor time-consuming. 24.10.77 as 044212 (2pp931).

ABBO D16 10637A/06 =GB 1543-130
Alpha-amylase enzymatic determination - in e.g. serum or urine using modified starch substrate and phosphorylase, phosphoglucomutase and glucose-(6)-phosphate dehydrogenase
ABBOTT LABORATORIES 01.07.76-US-701778
*B04 R16 + P31 (28.03.79) *DT2729-636 G01n-31/14*

Alpha-amylase is assayed in a sample by (a) reacting the sample with a modified starch substrate having blocked non-reducing ends, (b) reacting the resulting unblocked starch with phosphorylase in the presence of inorganic phosphate, (c) reacting the resulting glucose-1-phosphate with phosphoglucomutase, (d) reacting the glucose-6-phosphate with glucose-6-phosphate dehydrogenase in the presence of NAD or NADP to produce 6-phosphogluconate and NADH or NADPH and (e) measuring the NADH and NADPH

The samples are esp. biological fluids e.g. serum or urine. 30.6.77 as 027515 (4pp974).

Composites of microbes bound to porous support - with defined pore size characteristics
CORNING GLASS WORKS 26.06.78-US-918928 (14.09.77-US-833275)
(28.03.79) C12k-01/08

mmobilised microbe composites comprise a controlled population of microbes bound to the internal surfaces of pores in a water-insoluble nontoxic support having a high surface area. The microbes are (i) fission-reproducing microbes or bacteria, in which case $\geqslant 70\%$ of the pores have a dia. (d) such that $x_1 \leqslant d < 5x_2$ (where x_1 is the smallest and x_2 the largest dimension of the microbes or bacteria); (ii) yeast cells, in which case $\geqslant 70\%$ of the pores have $x_3 \leqslant d < 4x_4$ (where x_3 is the smallest and x_4 the largest dimension of the cells); or (iii) fungus-like organisms which reproduce via spores and exhibit mycelial growth, in which case $\geqslant 70\%$ of the pores have $x_5 \leqslant d < 16x_6$ (where x_5 is the smallest and x_6 the largest dimension of the spores).

The composites can be used for the prodn. of single-cell protein biomasses, for the prodn. of metabolites, and as standards for analytical microbiology. Supports with the above pore size characteristics give composites with the max. no. of bound microbes per unit wt.. 8.9.78 as 036168 (23pp367).

Vaccine for treating diseases caused by Vibrio microorganisms in fish - obtd. by inactivating mixed liq. culture of three antigen types of Vibrio anguillarum using formalin or heat
KITASATO RES INST 25.07.77-JA-089070
B04 C03 (21.02.79) A61k-39

In an example, brain heart infusion broth (pH 7.2) 25 g, fish meat extract 12 g and sodium chloride 26 g, were dissolved in distilled water and the resultant soln. sterilised by heating under high pressure. Fungi (mixt. of three kinds of aberrant form of Vibrio anguillarum) was innoculated into the above soln. and the mixt. was cultured at 27°C for 18 hrs. Glucose was added to a concn. of 2%, the pH of the mixt. adjusted to 8.2 and culture continued for 18 hrs. Formation was added to a concn. of 0.4% to produce an inactivated vaccine liquor, which was diluted 10 times for administration. 25.7.77 as 089070 (4pp69)

EIKE- ★ D16 24723B/13 ★J5 4023-188
Culture medium for detecting bacterial acyl:amidase - is prepd. by mixing acetamide with potassium hydrogen phosphate, sodium chloride, growth promoter, phenol red indicator and agar
EIKEN KAGAKU KK 22.07.77-JA-087965
B04 R16 (21.02.79) C12k-01/06 G01n-31/14 G01n-33/16

The culture medium is prepd. by combining proper amt. of acetamide in a basic medium contg. K hydrogen phosphate, NaCl growth promotor, indicator and agar. Acetamide is combined in an amt. of 1.0-5.0 (3.0)g in 1000 ml of the culture medium. An example of the compsn. is KH_2PO_4 1.0 g, NaCl 5.0 g, yeast extract 0.5 g, glucose 0.2 g acetamide 3.0 g, phenolred 0.03 g, agar 15.0 g and refined water 1000 ml and obtd. culture medium is regulated to have pH 6.8. The culture medium is poured in test tubes and after pasteurising them, the medium is solidified to slant form. A platinum loopful of the bacteria to be tested, is spread on the slant and the slant is cultured at 37°C for 18-24 hrs. When acylamidase is formed, the culture medium is turned to red and the colour change can be easily recognised.

The culture medium detects the bacterial acylamidase through the change in colour of the indicator by ammonia formed by the decompsn. of acetamide through acylamidase and the judgement can be practiced easily through the distinct colour change. The characteristics of the culture medium are to intensify the growth promoting effect by combining yeast extract and glucose and to use phenol red as the indicator for easy judgement of colour change. 22.7.77 as 087965 (4pp5)

AJIN ★ D16 24724B/13 ★J5 4023-192
Citric acid prodn. in high yield - by culturing a variety of Candida in a crude sugar, e.g. molasses
AJINOMOTO KK 19.07.77-JA-086276
E17 (21.02.79) C12d-01/04

The method comprises culturing a variety of Candida, which shows degenerated use for citric acid, sensitivity to Cu or Ni and producibility forccitric acid, in a nutritive culture medium; and collecting the citric acid accumulated. Large amts. of citric acid can be prepd.

Examples of the varieties are Candida citroformans AJ 14527 (FERM-P 4124) and C. citroformans AJ 14528 (FERM_P 4125), derived from the parent strain C. citroformans AJ 14500 (FERM-P 3397) through treatment with N-methyl-N'-nitro-N-nitrosoguanidine. The culture is practiced at 20-40℃ and pH 3-7 under aerobic condition for 2-5 days with regulation of the culture medium pH with calcium carbonate, sodium hydroxide, aq. ammonia, etc. and accumulated citric acid can be easily isolated by removing the yeast body from the culture medium, concentrating the clear culture medium, adding slaked lime to the concentrate and sepg. formed calcium citrate. 19.7.77 as 086276 (3pp5)

AJIN ★ D16 24725B/13 ★J5 4023-193
Citric acid and D-fructose prepn. - by culturing Candida microorganism in culture medium contg. sucrose or invert sugar
AJINOMOTO KK 23.07.77-JA-088625
E17 (D17 E13) (21.02.79) C12d-01/04 C12d-13

The method comprises culturing the variety of Candida which produces citric acid and does not use D-fructose, in the culture medium contg. sucrose or invert sugar as the major carbon source and collecting citric acid and D-fructose from the cultured liq.

An example of applicable variety is Candida citroformans AJ 14530 (FERM-P 4127) and the variety is derived from the parent strain of C. citroformans AJ 14473 (FERM-P 3072). As the carbon source, refined or crude sucrose, beet molasses, cane molasses, fruit juice, invert sugar, etc. can be used. The culture is practiced at 20-40°C at pH 3-7 aerobically and during the culture pH control is practiced with $CaCO_3$, NaOH, aq. ammonia, etc. After the culture yeast body is removed from the culture medium and the culture medium is concentrated. Slaked lime is added to the concentrate and citric acid can be firstly recovered as Ca citrate. The mother liquor is concentrated again and $CaCl_2$ or slaked lime is added to the concentrate. Fructose is recovered as its double salt with $Ca(OH)_2$ or $CaCl_2$. 23.7.77 as 088625 (3pp5)

AJIN ★ D16 24726B/13 ★J5 4023-194
Inosine-5'-mono:phosphoric acid prepn. - by culturing Bacillus bacteria, useful as seasoning etc.
AJINOMOTO KK 20.07.77-JA-086961
B02 E11 (D13) (21.02.79) C12d-13

The method comprises culturing Bacillus bacteria which has requirement for adenosine and xanthine and is resistant to methioninesulphoxide, cichoflanin, decoinin or sulphaguanidine in culture medium and collecting inosine-5'-monophosphoric acid (I) accumulated in the culture medium.

(I) is useful as seasoning, etc. can be prepd. efficiently. Examples of strains are Bacillus subtilis AJ 11154 (FERM-P 4116), B. subtilis AJ 11155 (FERM-P 4117), B. subtilis AJ 11156 (FERM-P 4118), B. subtilis AJ 11157 (FERM-P 4119) and B. subtilis AJ 11158 (FERM-P 4120). The culture is practiced at 34°C at pH 4-8 aerobically for 1-5 days. 20.7.77 as 086961 (3pp5)

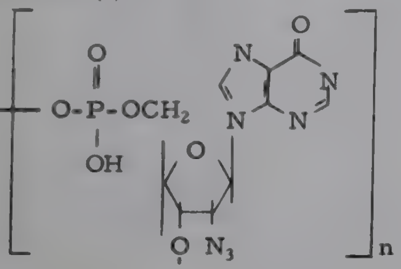
MURA/ ★ D16 24727B/13 ★J5 4023-196
Microbial alkaline protease inhibitor prodn. - by culturing ray fungus of Streptomyces genus, used for treating shock, pancreatitis and haemorrhaging
MURAO S 22.07.77-JA-088053
B04 (21.02.79) A61k-35/74 C12d-13

In an example, a culture medium contg. 1 l of water, 10g of glucose, 30 g peptone, 0 g meat extract, 1 g sodium chloride, 1 g dipotassium phosphate and 1 mg manganese sulphate hexahydrate was adjusted to pH 7.0 and respectively 100 ml of the culture medium wasput into ten Sakaguchi's flasks (500 ml volume) and sterilised at 120°C for 10 mins.

Respectively one platinum loop of Streptomyces nigrescens WT 27 FERM-P 4131 streak culture medium was inoculated and cultured under shaking at 30°C for 30 hrs. (120 r/min.). After completion of culture, culture liquor was subjected to centrifugal sepn. to remove fungi body and yield 800 ml of supernatant liquor. Sublicin BPM'-inhibition ratio of 50 µL of the culture filtrate was 80%. 22.7.77 as 088053 (6pp69)

MITU ★ D16 25063B/13 ★J5 4024-899
Poly-2'-azido-2'-deoxy:inosinic acid - used as inhibitor of reverse deoxyribonuclease and in prodn. of interferon derivs.
MITSUBISHI CHEM IND KK 26.07.77-JA-089478
B04 (24.02.79) A61k-31/70 C07g-17 C12d-13/06

Poly 2'-azido-2'-deoxyinosinic acid (polynucleotide) of formula (I) is new.



(I) is prepd. by, e.g. polycondensating 2'-azido-2'-deoxyinosine 5'-diphosphate (II) in the presence of polynucleotide phosphorylase (PNPase). (II) is prepd. by e.g. reacting 2'-azido-2'-deoxyadenosine 5'-phosphate with nitrous acid to obtain 2'-azido-2'-deoxyinoxine 5'-inosine 5'-phosphate, reacting this prod. with morpholine in the presence of a dehydrating agent (e.g. dicyclohexylcarbodiimide) and substituting the prod. with phosphoric acid. PNPase can be recovered from microorganisms, e.g. E. coli Axotobacter vinelandii, etc. or various animal tissues.

The polynucleotide acts as an inhibitor against reverse DNAase. The polynucleotide associated with polycytidylic acid exhibits about 4 times the activity that of the polynucleotide of polyinosinic acid associated with polycytidylic and is useful as intermediate of interferon derivs. 26.7.77 as 089478 (6pp140)

MITU ★ D16 25064B/13 ★J5 4024-900
Double chain polynucleotide - obtd. by association of poly 2'-azido-2'-de-oxy inosinic acid with poly:cytidylic acid, used to derive interferon
MITSUBISHI CHEM IND KK 26.07.77-JA-089479
B04 (24.02.79) A61k-31/70 C07g-17 C12d-13/06

Polynucleotide of double chain is obtd. by association of poly 2'-azido-2'-deoxyinosinic acid with polycytidylic acid. The polynucleotide is useful as interferon deriving agent exhibiting ∼ 4 times the activity that of the known polynucleotide of double chain obtd. by association of polyinosinic acid with polycytidylic acid.

Poly 2'-azido-2'-deoxyinosinic acid is obtd. by polycondensation of 2'-azido-2'-deoxyinosine 5'-diphosphate in the presence of a polynucleotide phosphorylase. The 2'-azido-2'-deoxyinosine 5'-diphosphate is obtd. by e.g. reacting 2'-azido-2'-dcoxyadanosine 5'-phosphate with nitrous acid to obtain 2'-azido:2'-deoxyinosine 5'-inosine 5'-phosphate, reacting this prod. with morpholine in the presence of a dehydrating agent (e.g. dicyclohexylcarbodiimide) and substituting the prod. using phosphoric acid. Associationof poly 2'-azido-2'-deoxyinosinic acid and polycytidylic acid is effected by mixing an aq. soln. each of them at a molar ratio of 1:1. 26.7.77 as 089479 (6pp140)

Malt drying kiln - has housing with radial shafts around central air duct
VORON TECHNOL INST 25.02.75-SU-111554
Q76 (05.04.78) C12c-01/04 F26b-17/12

Reduced heat intake and improved quality of the dried malt are due to the kiln design with radial shafts in the housing. The space between the shafts is connected to the central air duct via additional tubes with dampers. Each drying zone of the shafts has louvres on the side facing the inlet of the drying agent.

The malt reaches the drying zone of the shaft through the funnel and tube, where it moves by gravity. When one shaft is loaded, another shaft is unloaded, and the drying agent is fed between the first and last shaft through the central duct, when the louvres of the last shaft are closed After passing the malt in the remaining shafts, the drying agent is exhausted by the ventilator.

Rectified alcohol prodn. plant - feeds overhead contg. fraction from fractionating column into stripping column
UKR LIQ SPIRITS IND 12.07.76-SU-382266
(05.04.78) C12f-01/06

Decreased heat losses and improved rectified alcohol are achieved by treating the fraction with impurities in the stripping column at a pressure of $0.2.10^5$-$0.6.10^5$ Pa. The derived prod. is divided into one part which returned to the fractionating column, while the other part is combined with the purified product of the fractionating column. The combined product is subject to rectificationat the same pressure as above.

The purification in the stripping column is carried out with the heat of alcohol vapours from the fractionating column, while the rectification is made with the heat of alcohol vapours from the mash column. The preheated mash is fed to the distillation column operating at a pressure of $1.2.10^5$ - $1.3.10^5$ Pa and heated by live steam.

Strong wines heat treatment unit - combines two streams subjected to different regimes, by feeding them into mixer-aerator
AS KAZA MICOBIOL 17.08.76-SU-399981
(04.04.78) C12g-01/02

Intensified treatment of strong wines and their saturation with oxygen are due to combining two flows which were subject to different regimes. The circulation loops are parallel-connected via a mixing aerator.

After filling the two tanks with wine, all valves are opened for a free flow with air exhausted through the non-return valve. The centrifugal pump forces the wine in the first loop heated to 50-60°C while the surplus overflows to the next tank.

Bacterial strain Proactinomyces phosphaticus - is used to produce antimicrobial material active against Gram-positive and Gram-negative bacteria
PIKOVSKAYA R I 01.07.76-SU-378549
(05.04.78) C12k-01

The optimum incubation temp. of the strain is 28°-29°C. On the second day of incubation the culture on all media forms milky coloured colonies having a mucous-like consistency. After 3-4 days the biomass becomes coloured, the colour depending on the medium.

The mycelia on a culture are atmospheric, the colonies being slightly fluffy and the conidia being oval or circular with straight stems. An optimum medium for the development of antimicrobial props. comprises (per l. of water): 6g. peptone, 3 mls. yeast extract, 5g glucose and 20g. agar-agar at pH 6.6-6.8, with sterilisation at 0.5 atmos. The strain ferments gelatin and milk and converts glucose, saccharose, mannitol and inositol to acid and arabinose, rhamnose, sorbitol lactose and dulcite to alkali, no gas is evolved. Starch is not hydrolysed but nitrate is reduced to NO_2. Phosphatase is developed in the medium and the medium shows a neutral reaction. Growth is positive in nor

-glucose media.

The antimicrobial materials obtd. from the culture are active against Gram-positive and Gram-negative microflora: Staph. aureus 8357, Bac. mycoides 537, Bac subtilis (spores) Z_2, B act. Escherichia coli. The materials are obtd. from a sterile filtrate of the culture liq. on filtering through a Chamberlain Z_5 bacterial filter.

Bacterial strain of streptococcus lactis - is used to expose bacteriophages of lactic streptococci

BUTTER CHEESE PROD (BELU) 03.05.76-SU-357582

(D13) (05.04.78) A23c-09/12 C12k-01/02

The cells of a 24 hr. of a Streptococcus lactis N3938-S culture on agar and hydrolysed milk are 1-1.1μ in dia. they are ellipsoidal and form short chains. In a broth of hydrolysed milk the intensive growth stage produces a heavy, uniform suspen. and a 24-hr. growth produces uniform turbidity with a grainy ppte., which forms a thin layer at the bottom.

On inoculation of fresh broth with 1 vol.% of an 18-hr; culture in a hydrolysed milk the 'lag' phase is observed in 60 mins. The max. cell concn. is 8-10 x 10^8 cells/ml. formed after 7hrs. incubation at 30°C; viability is maintained with streptomycin concns. in the broth of up to 1000 units/ml. On inoculating milk with 1% of an 18 - hr. culture, a curd forms in 11-12 hrs. having a dense, uniform consistency. On injecting a meat - peptone gelatin, weak growth occurs along the line of the injection; the gelatin does not liquefy. On inoculating a hydrolysed milk agar, colonies are formed in 2 days having a round, smooth, white, lustrous, convexed appearance and size 0.8-1mm. Their viability is maintained at streptomycin concns. in the medium of up to 1000 units/ml.

The strain converts glucose, galactose, lactose, and maltose to acid; saccharose and mannitol are not assimilated. It is sensitive to 24 naturally occurring lactic streptococci virulent bacteriophages.

Alpha galactosidase prodn. - by culturing moulds of genus absidia in inducer contg. medium

HOKKAIDO SUGAR KK (HOKK-) 03.01.75-US-538468

*(20.04.78) *US3957-578 C12d-13/10*

α-Galactosidase (I) is produced by culturing Absidia griseola (ATCC No. 20430) or Absidia griseola var. iguchii (ATCC No. 20431) in a culture medium contg. substances (II) inductive of (I) under conditions permitting the formation of (I). Process produces high α-galactosidase activity and absolutely no invertase activity is produced in the mycelium. By treating beet molasses or beet juice with the mycelium (or an extract) (claimed process) the yield of sucrose can be enhanced since raffinose (which hinders crystallisation of the sucrose) is effectively decomposed and sucrose is allowed to remain intact. The Absidia spp. ATCC 20430 and 20431 are stated to be new.

(II) is e.g. lactose, melibiose, raffinose or galactose. The culture medium may also contain 0.2-1.0% of an organic acid e.g., citric lactic, glycolic, fumaric, glutaric malic tartaric, succinic, malonic, maleic, pyruvic or galacturonic acid. The medium may contain carbon sources e.g. starch glucose glycerine, maltose, dextrin etc. nitrogen sources e.g. soybean flour, peanut powder, meat extract, peptone, yeast extract, etc., and inorg. salts e.g. NaCl, KCl, $MgSO_4$ $MnSO_4$, iron sulphate, phosphates and $CaCO_3$. Culture is carried out at ca 30°C for 40-70 hours at pH 5-8. The mycelium can be obtd. e.g., in the form of pellets in the known way, e.g. by filtration, washing with water, centrifuging and drying, etc.

Immunological testing device with vertical passages - retaining liquid by capillary action but permitting washing
PARK H 29.11.76-US-745541
B04 R16 (05.09.78) C12k-01/10 G01n-31/14

An immunological testing device includes an array of vertical passages within a cylindrical housing. The passages connect with a common manifold at the upper end of the housing which allows liquid to be loaded into the passages where it is then retained by capillary action. Typically the passages are defined by a finned insert which is located within the tubular housing to give a surface area larger than the cross sectional area of the housing.

A washing structure may be placed over the upper end of the device and washing liquid added to overcome the capillary action thus releasing liquid from the lower ends of the passages where it enters a common funnel shaped discharge manifold.

The device is used in immunological testing e.g. enzyme-linked immunosorbent assay, non-competitive, for the determination of antigens. Liquid is retained in the passages by capillary action but can be washed out by adding a greater quantity of liquid. 29.11.76 as 745541 (8pp295)

Removal of trace heavy metal contaminants from algae contg. λ-carragheenin comprises treating the algae with an aq. soln. of a sol. food grade K salt effective for the removal. Amt. K^+ is < 1.0 mole/l and temp. is ≤ 10° such that no appreciable extn. of the λ-carragheenin from the algae occurs.

Pref. algae are Gigartina and Iridaea spp., esp. G. acicubris and G. pistillata. Pref. K salts are K_3PO_4, K_2HPO_4, $K_4P_2O_7$ and esp. KCl. Wt. ratio K soln.:algae is > 7:1. Washing is pref. for 10 min - 2 hrs.

Used for removal of Cu, Zn, Hg, Cd, Pb and esp. As. The λ-carragheenin obtd. is useful in food prods. as an emulsifier, stabiliser and thickener. 26.10.76 as 735461 (4pp949)

MACH- ★ D17 24007B/13 ★BE -872-161

Infrared preheat of sugar lumps between moulding and drying - to prevent surface condensation and thermal shock

MACHINES CHAMBON SA 08.12.77-FR-037075
(16.03.79) C13f

The process is of the type in which lumps are conveyed from a moulding machine into an infra-red radiation, drying oven. Before entering the oven the lumps are now preheated for a very brief period by infra-red radiation so that each lump becomes enveloped in a cloud of water vapour. The cloud provides an insulating barrier to the infra-red radiation to prevent lumps heating up too quickly, bu ensuring that the surface temp. of each lump is above dev point as it enters the drying oven.

The preheating period pref. extends over 2-3 secs. and raises the surface temp. of each block to 65-80°C. The infra-red radiation for preheating is pref. employed at a wavelength of 3-6 μ.

The costs of controlled atmos. drying are not incured. 21.11.78 as 872161 (7pp448)

MACH- ★ D17 24008B/13 ★BE -872-162
Drying tunnel esp. for moulded moist sugar lumps - uses air at controlled temp. and humidity in cross flow pattern.
MACHINES CHAMBON SA 12.12.77-FR-037328
Q76 (16.03.79) C13f F26b

The process is of the type in which a prod. of moulded powder, esp. a sugar lump moulded from agglomerated moist powder, is conveyed through successive sections of an oven in which the temp. and relative humidity of the air is controlled. A main air flow is cocurrent to prod. travel in the first oven section and countercurrent in the second section. Simultaneously in both sections, an auxiliary air flow is directed at right angles to direction of prod. travel to homogenise the atmos. in each section.

In the first section, drying is pref. comparatively slow with humidified, auxiliary air while, in the second section drying is comparatively rapid with a much higher throughput of unhumidified air.

Drying is carried out with precise control of temp. and humidity to avoid thermal shock damage to prod. this is achieved without resorting to an oven with expensive arrangement of sealing the atmos. 21.11.78 as 872162 (13pp)

Continuously operating centrifuge - with endless flight conveyors for feed application to and solids removal from screen drum
SELWIG & LANGE 21.09.77-DT-742422
J01 P41 (22.03.79) B04b-11/02

A continuously operating centrifuge to separate a mixt. of solids and liq. consists of a revolving vertical drum screen. The application device for the feed and the discharge device for the solids consists of endless belts with flights which are driven by a common chain.

A safe discharge is ensured under all working conditions and a gentle handling of the solids, which are esp. sugar crystals. 21.9.77 as 742422. (15pp39)

GUIL/ ★ D17 24249B/13 ★FR 2395-057
Decanter for purifying water contg. particulate materials - incorporates scraper which can be lifted clear of deposited mud, facilitating starting after prolonged stoppage
GUILLAUME J P 22.06.77-FR-019552
J01 (23.02.79) B01d-21/06

A decanter, consisting of a decantation tank and a scraper driven axially to circulate decanted mud from the periphery of the tank to the centre where it is discharged, incorporates means of raising or lowering the scraper, pref. independent of its means of rotation, and such that the rate of lifting is considerably greater than that of lowering.

Used partic. for the pruificn. of water which has been used to wash material extracted from quarries and sand-pits or coal or mineral mines. Process facilitates starting of the scraper after a prolonged stoppage resulting in a thick layer of mud. The scraper can be raised out of the layer, then started up and lowered so that it enters the mud in a very progressive manner until it comes back to its normal operating regime. Decanter may be used when decantation gives rise to the formation of dense muds, e.g. in sugar refining, in the cases when a flocculating agent is made heavy by a flocculant and in the case where a ppte. is formed by crystallisation in a liq. medium other than water. 22.6.77 as 019552 (9pp1192)

CORP D17 34997A/20 =GB 1543-094
Maltose prepn. by enzymatic saccharification of starch - carried out on a porous support in presence of a thiol cpd.
CPC INT INC 04.01.77-GB-000087
*E13 (D16) (28.03.79) *BE-862-614 +C13k-07*

Maltose is prepd. from starch by enzymatically saccharifying liquefied starch with beta-amylase enzyme. Enzyme is immobilised by being physically adsorbed onto a porous carrier material, wherein the saccharification is conducted in the presence of an organic material having a thiol function.

polypeptide, water-insoluble synthetic polymers or their mixts. Pref. enzyme is immobilised in a column through which the liq. starch is passed in saccharification. A debranching enzyme, pullulamase, is also employed in saccharification.

Working life of beta amylase is improved and extended, enzyme being sensitive esp. in dilute soln.. 3.1.78 (6pp).

MANI- D17 23673A/13 =GB 1543-134
Measuring water content of crystalline sugar - from electrode potential between two metals in an electrolyte contg. sugar
INST MANIPULACNICH 21.09.76-CS-006112
*R16 (28.03.79) *DT2742-479 G01n-27/46*

A device for indicating the free water content of hydrous crystalline material includes a cathode and anode of different materials coupled to an evaluation unit consisting of an amplifier, a pulse counter and a comparator.

The amplifier output is connected to a meter checking the existence of potential and to a trigger circuit. The comparator compares data from the counter output with a preset value to provide an output signal indicating water content.

The device is very sensitive, and may be used to detect low concns. of water in sugar. 15.9.77 as 038524 (4pp).

NIHA- ★ D17 24709B/13 ★J5 4023-136
Refined sugar liquor prepn. - without using crystallisation and using the equipment used to prepare muscovado
NIHON HAISUI SEKKEI 21.07.77-JA-087545
(21.02.79) C13j-01/02

The method comprises (1) adding an aq. soln. of raw egg white, dry egg white, casein or konjak to raw sugar juice, (2) heating the mixt. to promote coagulation of the additive (3) including impurities in sugar juice, such as soluble starch, protein, etc., in the aggregate, (4) screening it to remove the formed floating sum, (5) decolourising it with active carbon, (6) filtering and (7) concentrating it.

Raw sugar juice obtd. by pressing cane can be processed directly to refined sugar liquor without crystallisation. The process is cheap.

Raw sugar juice obtd. by pressing cane has a concn. of 8 Be, but its filtrability is poor. The aq. soln. of egg white, etc. is added to improve filterability and the mixt. is heated to 90-99°C. Floating scum is removed using a 40-80 mesh screen and the clear sugar juice is decolourised with active carbon in two steps. The first step uses waste active carbon recovered from the second step and the second step uses new active carbon. Finally, the treated decolourised sugar juice is concd. under reduced pressure to a refined sugar liquor of > 26 Be. 21.7.77 as 087545 (3pp5)

NISS- ★ D17 24710B/13 ★J5 4023-137
Edible liq. sugar prepn. from molasses - by diluting molasses, adding acid, desalting by electrodialysis using ion exchange membrane and neutralising
NISSHIN SEITO KK 25.07.77-JA-088934
(21.02.79) C13j-01/02

Method comprises (a) diluting molasses to Bx 25-35, (b) adjusting pH of the diluted molasses to 0.5-3.5, (c) desalting it by the electrodialysis using ion exchange membrane and (d) neutralising the desalted molasses to pH 5.5 -7.5.

The desalting of molasses can be excellently with high efficiency by electrodialysis without partic. pretreatment under acidic condition of pH 0.5-3.5. Desalted edible molasses free of bitterness and astringency can be obtd. The ion exchange membrane is regenerated every three cycles and can be used for long time with keeping high desalting efficiency. 25.7.77 as 088934 (4pp5)

NIRT ★ D17 25090B/13 ★J5 4024-937
Rust resistant compsn. for use in concrete - comprises calcium nitrite, beet sugar, waste liq., benzotriazole and tri:alkanolamine
NISSO MASTER BUILDERS 27.07.77-JA-089943
E16 L02 M14 (E13 E33) (24.02.79) C04b-13/20

Compsn. contains (1) 100 pts. wt. calcium nitrite, (2) 3-20 pts. wt. (as solids) of beet sugar Stephen waste liq., (3) 0.5-5 pts. wt. benzotriazole and (4) 1-10 pts. wt. trialkanolamine.

Pref. (2) is the liq. by-produced in the Stephen process during the prodn. of beet sugar. (4) includes, e.g. tri ethanolamine, trimethanolamine, triisopropanolamine. (3) contributes to maintenance of the rust resistance of the compsn. for prolonged periods of time. The compsn. is used in amt. 0.5-2 kg/1 m^2 concrete.

The compsn. shows better rust resistance than calcium nitrite alone. 27.7.77 as 089943 (4pp136)

Polymer hair setting treatment
COLGATE PALMOLIVE CO 29.05.69-US-829116
*A16 F06 (A87 A96 D18) (22.03.79) *BE-751-185 A61k-07/09*

Hair is permanently waved or shaped by first treating with a reducing agent, e.g. ammonium thioglycolate to convert some of the disulphide gps. in the hair to mercaptan gps. Excess agent is removed by rinsing with water and the hair is treated with an olefinic monomer and a peroxide catalyst to graft polymer onto the hair. Unreacted monomer and catalyst are removed and the moist hair is put in the desired form and dried. The moist hair can be repeatedly shaped and dried.

The pref. monomers are methyl methacrylate, lauryl methacrylate, dimethylaminoethyl methacrylate and itaconic acid. 25.5.70. as 025452 (15pp068)

The concn. of a disinfectant in the water of a swimming pool is controlled by adding a predetermined amount of disinfectant within a cycle. Between this moment and the subsequent taking of a sample, a predetermined time is allowed to elapse. The concentration is then measured by adding an indicator to the sample. The whole process is cyclically repeated to keep the concentration within narrow limits.

This allows for a time which is necessary for a homogeneous distribution of the disinfectant. 14.2.69. as 907486 (9pp39)

Burning air from isolation compartment of ambulance - heat can be fed to radiator

BINZ CO 30.07.73-DT-338601

*P33 P34 +Q12 Q15 (15.03.79) *BE-818-261 B60h-03*

The air from an isolated ambulance in which patients with infectious illnesses are carried is drawn off via a suction fan and is fed into a combustion chamber to be mixed with fuel oil and ignited before being exhausted to the atmosphere. The bacteria present in the air are killed by the heat of combustion.

The vacuum created by the fan ensures that the pressure in the interior of the passenger compartment of the vehicle is lower than atmospheric so that no air escapes from the interior via leaks in the vehicle body. The heat generated in the combustion process is transferred into the cooling water circuit of the vehicle engine cooling system. The heat is then given up in the vehicle radiator or can be used to heat the interior of the vehicle as dictated by a thermostat control in the passenger compartment. 24.7.74 as 010017. (5pp1370)

Mineral fibre panel mfg plant with wet scrubber - for fumes repeatedly recycled through fibres being processed
SAINT-GOBAIN INDUSTRIES 10.10.73-FR-036169 (22.10.76-FR-031860)
*F04 L01 +P43 (05.09.78) *BE-820-942 C03b-37/04*

Mineral fibres are formed by gas blast attenuation, the fibres being collected on a foraminous surface and the gas being recirculated. The flow ahead of the surface is sprayed with water and water and entrained solids are separated from the gas in the recirculation path. Separated water is heat-exchanged with a medium and solids are separated from it.

The water is recirculated to the spray heads. Gas temperature in the forming section ahead of the surface is regulated by varying the heat transfer between separated water and medium. Heat-exchange may be indirect, or the medium may be air into which the water is sprayed.

Controlling water repellency of nonwoven fabric - by heating to decompose surfactant in the binder, for diaper facing sheets

JOHNSON & JOHNSON 04.04.77-US-783928

A81 F04 P32 (F09) (05.09.78) A61f-13/16 D21h-01/34

Water repellency of selected regions of a wettable, bonded non-woven fabric contg. a heat-labile surfactant (I) is increased by heating these regions to a temp. at which (I) is unstable for long enough to denature (I) without damaging the fabric.

(I) is nonionic and/or ionic, specifically an alkanedicarboxysulphonate ester salt; polyoxyethylene deriv. of partial long chain fatty acid ester or a polyoxyalkylene sorbitan monolaurate. Esp. Na dioctylsulphosuccinate or polyoxyethylene (20) sorbitan monolaurate are used. The fabric is pref. heated to 240-600 (280-400)°F for 10-100 (20-60) secs.

Used for making fabric of controlled wettability for use as facing sheets in disposable diapers. 4.4.77 as 783928 (7pp1251)

OLIN ★ D22 25845B/13 ★US 4112-154

Cigarette tipping papers of uniform porosity - made by printing base papers with inks of various viscosities depending on porosity

OLIN CORP 02.09.77-US-830183

A82 F09 P73 P78 (A11) (05.09.78) B32b-07/14 B44d-05

Uniform porosity in porous cigarette tipping papers made from base papers of different porosity is achieved by first measuring the porosity of the base paper. This is then coated with a liq. soln. having a relatively higher viscosity for lower porosity paper, and a lower one for high porosity paper. A predetermined uniform porosity is achieved in the coated area.

The soln. is a printing ink (esp., coating suspension, paper size, cellulose ether or carboxymethylcellulose. It can be applied evenly over the entire paper or over random areas on one surface. Esp. it has viscosity 8-11 sec (Zahn) and the base paper has porosity 700-1800 Filtrona air permeability units.

Used in ventilated filter tip cigarettes. Uniform porosity ensures uniform air dilution and hence consistent tar and nicotine yields. 2.9.77 as 830183 (4pp1251)

PROC D22 49719A/28 =US 4112-167

Skin cleaning tissue, esp. toilet paper - of low density material impregnated with lipophilic cleaning emollient

PROCTER & GAMBLE CO 07.01.77-US-757712

*F09 P28 +P73 (05.09.78) *BE-862-731 B32b-21/04 +B32b-03*

Skin cleansing product, especially suitable as toilet tissue, comprises a soft flexible web with a low density wiping zone of void index under 1 p.s.i. pressure of 10-68; the wiping zone is treated with 10-150% by weight of lipophilic cleansing emollient comprising a mixture of isopropyl palmitate, cetyl alcohol, non-ionic surfactant and petrolatum.

The lipophilic cleansing emollient reduces dehydration of the soil and weakens soil-skin adhesive forces while the wiping zone entraps and removes the soil from the skin. Improved skin cleansing properties are provided. 7.1.77 as 757712 (9pp1364)

Edible oils with increased polyunsaturated acid content - by extraction with N-substituted amide solvents

UNILEVER NV 18.10.72-GB-048039

*(19.04.78) *NL7314-265 C11b-07*

The content of polyunsaturated fatty acids bound to glycerol in edible oils containing ≥ 50% linoleic acid is raised by (a) contacting the oil with a solvent system consisting of an N-substuted amide at a temp. at which two liquid phases are formed, one of which is an oil fraction rich in bound linoleic acid dissolved in the polar solvent and the other is a light fraction contg. the remainder of the oil, (b) separating the two fractions, (c) removing the polar solvent from the rich fraction and (d) recovering the oil fraction rich in bonded linoleic acid.

Products have a high content of polyunsaturated acids bound to glycerol and are thus more suitable for consumption, e.g. in margarine, cooking fat and frying oils.

The starting oil is pref. high in linoleic acid content, especially safflower oil, sunflower oil or cottonseed oil. The polar solvent is e.g. dimethylformamide or N-methylpyrrolidone. The polar solvent may contain small amount of water or a 1-4C alkylene glycol in a wt. ratio 4:1 to 10:1. The oil may be mixed with a non-polar solvent before extraction to increase the density difference between the two phases: suitable non-polar solvents are, e.g. 3-10C paraffins and especially a light petroleum fraction wit a boiling range of 96-98°C. The extraction may be carried out continuously, e.g. in counterflow at -20 to +50°C.

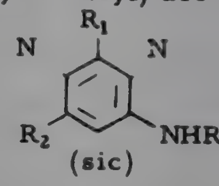
LEVER BROTHERS CO 24.10.75-GB-043849

*E24 (E13) (05.09.78) *DT2647-421 C07d-251/08*

Non-fluorescent triazine deriv. impurities of formula (I) (where R_1 is O H or halogen; R_2 is OH or $-NR_4R_5$; R_4 and R_5 are each H or (substd) alkyl or aryl; and R_3 is (substd.) alkyl or aryl) are removed from fluorescent agents, selected from 4,4'-di(sym-triazinylamino)stilbene-2,2'-disulphonic acids and salts, by contacting, at 1 atmos. and ⩾ 75°C, with an aq. soln. contg. 0.5-5 wt.% alkali metal hydroxide, in an amt. of 25-150 ml/g of fluorescent agent, which remains undissolved; and sepg the fluorescent agent from the aq. soln.



(I)

The process is simple and avoids prior art disadvantages. 22.10.76 as 734686 (4pp976)

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11 : BAKING

BURG- ★ D11 26011B/14 ★DL-133-394
Oil spray tunnel for dough - with contact operated spray nozzles and screens forming chambers
VEB BURGER KNACKEW 29.09.77-DL-201260
(03.01.79) A21d-08/08

A fine mist of oil is sprayed on lumps of dough as they move on a belt conveyor through a spray tunnel. Cloth screens subdivide the tunnel into several chambers. On contact with a switch, the lumps are exposed to allround oil mist from flat jet nozzles.

This results in savings in oil consumption and prevents the egress of oil mist from the tunnel. 29.9.77 as 201260 (12pp39)

TSCH/ ★ D11 26164B/14 ★DL-133-891
Sliced bread packaging - with extra heat treatment of sealed package after hot slicing and packing
TSCHEUSCHNER H D 27.09.77-DL-201216
(31.01.79) A21d-15/04

Sliced bread in airtight polyethylene packages is sliced when hot (50-70 °C) and packed without letting the temp. dropping below 40 °C. A brief heat treatment for 10-20 min. at outside temps. of 120 °C and core temps. of 60-80 °C follows before the packages are cooled to 35° and inserted in dispatch containers.

This results in bread which remains saleable for 14-30 days and required no time-consuming cooling period or power-consuming heat sterilization. No chemical preservation agents are needed. 27.9.77 as 201216 (5pp39)

PENN D11 07614S/04 =DS 2034-922
Di (3,3,6-trimethyl cyclo hexyl) peroxydicar - bonates as polymerisation initiators
PENNWALT CORP 15.07.69-US-841998
*A18 E15 G02 (A51) (29.03.79) *NL7010-424 +C07c-179/14 C08f-04/36*

Di-(cis-3, 3, 5-trimethyl-cyclohexyl) peroxydicarbonate (I) and a solid isomeric mixt. contg. ⩾ 70% (I) is claimed.

These cis isomers are far more stable than their trans isomers, are storage-stable, std. hydrocarbons-sol. and are not impact-sensitive. They are useful as (co)polymsn. initiators and curing agents and as gen. oxidants and dryers (for linseed, tung, soy bean oils etc.). 14.7.70 as 034922 (4pp922)

HEBE- D11 54314X/29 =DS 2448-902
Flame fired baking oven for waffles - in which air for combustion cools the housing and is preheated in the chimney stack
HEBENSTREIT GMBH 15.10.74-DT-448902
*(29.03.79) *DT2448-902 A21b-01/28*

Oven for baking waffles by means of baking clamps moved continuously by endless chains through a heating zone with at least one battery of burners, makes more efficient use of the fuel and the heat generated, whilst putting less smoke into the atmos.

The housing forming the heating zone acts as a heat exchanger and has double walls between which there are chambers with inlets through which the fresh air for feeding the burners passes. 15.10.74 as 448902 (5pp1045)

NIOF ★ D11 26861B/14 ★J5 4026-345
Rice-contg. bread prodn. - from flour, rice powder and natural protein decomposition prod.
NIPPON OILS & FATS KK 28.07.77-JA-089755
(27.02.79) A21d-13

The method comprises preparing the bread dough mainly of flour and rice powder and combining the decomposition product of natural protein of mol. weight 1000-10000.

The aggregating property of the dough is increased [illegible] is decreased. Thus undesirable effects of the rice powder in the bread dough can be settled and the problems encountered by preparing rice-combined bread, can be obviated. Excellent bread can be prepd. with high efficiency.

As the decomposition product of natural protein, polypeptide of mol. wt. 1000-10000 can be used favourably and it can be prepared by hydrolysing animal protein such as collagen, egg white, milk protein, etc. or vegetable protein such as soy bean protein, wheat protein, etc. with acid or enzyme. 28.7.77 as 089755 (4pp5).

KIFO= ★ D11 27397B/14 ★SU-607-183
Bread baking oven humidity and temperature automatic regulator - uses switching and time relays, parameters sensors and commutators
KIEV FOOD IND TECH 06.06.72-SU-793854
R26 (27.04.78) G05b-11/32

Multipositional relay-pulse automatic regulator is used to control humidity and temp. of bread baking ovens and uses programmer, commutators, relay amplifier, time relays parameter sensors and actuating mechanisms.

Wider range of functional possibilities is ensured by connecting the relay-time unit to the second and third commutators and to the actuating mechanisms.

The inputs of the two time relays via the commutators are joined to the regulated parameter sensors which reduces pulsation and keep the temperature within (2 °C) of the norm for a period of 105 min.
Kalenichenko, G.F., Ivanchenko, G.F., Piven, E.N. Bul 18/15.5.78. 6.6.72. as 793854 (2pp847)

HANS/ D11 64599Y/36 =US 4144-615
Appts. for cleaning bakery bun pans - includes suction hood with blowing device for removing material loosened by brushes
HANSON D R 26.06.75-US-590404 (09.08.74-US-496105)
*P43 +P28 (20.03.79) *US4044-420 B08b-09/08 +A47l-15/38*

A pan cleaning appts. includes a frame, a device for moving the pan along the frame, a brush reciprocatably mounted on the frame to engage the pan as it is moved, and a vacuum hood to be superposed over the pan after the pan has been cleaned by the brush. The hood is supported on the frame by a sub-frame pivotable to raise the hood. A stop member stops excessive movement of the sub-frame towards the pans. The brush is pref. mounted on the frame by a pivot shaft.

Different sized pans are effectively cleaned. The parent patent (64599Y) uses a blowing device rather than a suction device to remove loose material. 20.7.77 as 817435 Div. ex. 4044420 C.i.p. 3999238 (+26.6.75-US-590404) (10pp1376)

FONT/ D11 02015A/02 =US 4145-143
Mixing foundry sand to obtain specific properties - where vol. of mixt. is used to control addn. of water and swelling agents
FONTAINE A M (MAGO-) 01.07.76-LU-075276
*J02 M22 P53 R16 +P64 R26 (20.03.79) *BE-856-180 B28c-07/14*

Prodn. of foundry sand mixes in which sand is combined with water bentonite and/or carbon by monitoring continuously or intermittently the volume changes occurring in the mixture and using these results to control the rate at which the volume changing additive(s) are introduced.

The arrangement provides a simple method for ensuring that moulding mixtures of consistant quality are obtd. 29.6.77 as 811043 (5pp397)

D12: MEAT; FISH PROCESSING

PALM/ ★ D12 B/14 ★BR 7705-499
Fish drying process - by first blowing in air of controlled humidity, then storing fish in sealed chamber, then repeating first step
PALMA S M P 18.08.77-BR-005499
(20.03.79) A23b-04/04

HLAV/ ★ D12 B/14 ★CS 7802-326
System for automatic singeing of pigs
HLAVINKA J 10.04.78-CS-002326
(31.01.79) A22c-17

ZAND/ ★ D12 26028B/14 ★DL -133-427
Carcass transporter for abattoirs - with articulated carrier and suction cups
ZANDER D 20.10.77-DL-201607
Q38 (03.01.79) A22b-05 B66c-01/02

A transport device for quadrupeds or parts of them in abattoirs, e.g. to deposit them in scalding boilers, is fitted with suction cups which are directly applied to the part. The carrier to which the cups are fitted is shaped to suit the contours or is articulated.

Process saves manual labour for the transport. The cups can be adapted to suit different animals or parts of them. 20.10.77 as 201607 (8pp39)

MOHN/ ★ D12 26054B/14 ★DL -133-514
On-board fish meal preparation plant - with cutters and shredders for large fish by/passed by small fish
MOHNKE H 01.11.77-DL-201784
(10.01.79) A22c-25

A method of processing fish of all sizes on board fishing vessels to fish meal includes a rotary cutter which cuts up fish but is bypassed by small fish. A following mincing shredder with its worm conveyor feeder can also be bypassed before the fish reach the meal processor.

This saves the separate manual handling of large fish which are occasionally caught with the large quantities of smaller fish. They need not be thrown overboard and their albumins are not wasted. 1.11.77 as 201784 (7pp39)

SCHR/ ★ D12 26095B/14 ★DL -133-629
Synthetic viscose sausage casings - coated on both sides with animal protein to allow curing with fungus cultures
SCHREINERT F 22.10.77-DL-201619
A97 (17.01.79) A22c-13

Synthetic sausage casings are prepd. by applying a coating of animal protein to both sides of a viscose fabric by spraying or rolling, and partially substituting the wall thickness of the protein by viscose fabric.

The skins have a high water uptake capacity, so that osmotic pressure equalisation is maintained during treatment with fungi during maturation. The skins are esp. useful for ripening of meat prods. with cultures of particular fungi. The viscose fabric support layer has good elasticity and gives good protection against over-extension on filling. The two-sided protein coating gives good adhesion on the inside and allows growth of the fungus culture on the outside. The skin allows good breathing of the contents and is permeable to the mycelium of the fungus culture. 22.10.77 as 201619 (8pp513)

SCHR/ ★ D12 26096B/14 ★DL -133-630
Synthetic sausage skins prodn. from animal protein - using acetic acid treated collagen, formed into soln. with sodium aluminate and plasticised with aluminium enriched or sulphated oil
SCHREINERT F 20.10.77-DL-201620
(17.01.79) A22c-13

Synthetic sausage skins are made from animals protein using acetic acid. Acid aluminium sulphate or ammonium aluminium sulphate-12-hydrate is reacted with NaOH to form Na aluminate. Non-esterified, aluminium-enriched or sulphate plasticizers are added and the skins are made by extraction, with or without fibres.

The skins are esp. useful in the meat processing industry. The process allows acetic acid treated animal protein such as collagen to be processed into skins with reduced losses of acetic acid during processing and drying, thus giving higher yields and efficiency. The formation of the complex salts allows the use of conc. solns. which reduces the time necessary in the coagulation bath and obviates the need to use hardening baths. 20.10.77 as 201620 (10pp513)

SIEL/ ★ D12 26097B/14 ★DL -133-631
Mechanised flesh stripping for bones - by freezing, sepg. crushing and stripping
SIELAFF H 19.07.77-DL-200158
(17.01.79) A22c-17/04

The mechanised flesh stripping of bones in abattoirs begin with a freezing operation, followed by the removal of useless elements such as pigs teeth sets. The bones are then sepd. into parts requiring to pass a bone crusher and are finally charged into the flesh stripping machine.

Process increases the amt. of recovered from each animal but requires very little additional power or manual labour. 19.7.77 as 200158 (7pp39)

WRUC/ ★ D12 26130B/14 ★DL -133-753
Fish processing line transfer device - with discs on return pulley entering parallel slots on conveyor troughs
WRUCK S 11.11.77-DL-202011
(24.01.79) A22c-25/08

A transfer device for fish processing lines consists of a conveyor on which trays circulate between endless chains. The fishes lie sideways in recessed troughs which have several longitudinal slots. At the discharge pulleys, revolving discs penetrate into these slots and lift the fish clear of the trough.

The device ensures that the fish can be lifted evenly ou of the trough and are transferred in the right position to the next chute or conveyor. It is also suitable for similar requirements in the food and vegetable industry. 11.11.77 as 202011 (7pp39)

REIN/ ★ D12 26165B/14 ★DL -133-89
Cooked meat producing machine - with tubes on revolving dru periphery filled and discharged above hot fluid level
REINHOLD M 22.11.77-DL-202175
(31.01.79) A22c-18

Appts. for the forming and production of cooked meat is drum which dips into a heated liquid as it rotates. It carries on its circumference rectangular tubes which are filled with minced meat before immersion and emptied by a pusher ram after emergence on to a conveyor belt.

Arrangement saves much manual labour and removes any risk of contamination by germ carriers. The intensive heat transfer reduces the power requirement and shortens the treatment time. The tubes can be easily exchanged for the other shapes. Used for the prodn. of cooked meat, vegetable and pastry. 22.11.77 as 202175 (9pp39)

NMHB ★ D12 26212B/14 ★DS 2833-0
Fish side scale removing cutter - with conveyor and ventral guide plates
NORDISCHER MASCHINE 28.07.78-DT-833097
(29.03.79) A22c-25/02

Mechanical removal of the lateral shield scales of fish, e.g. of the species carangidae, is effected using ventral fillet cuts on both sides of the ventral fins to cut the fish up to the backbone. These cuts are used to guide th fish and the lateral shield scales are cut off as the fish being transported by its bone structure.

Process prevents undue tearing of useful parts of the fish and is suitable even when the fish are of floppy consistency. 28.7.78 as 833097 (5pp39)

SAUM- ★ D12 26482B/14 ★FR 2395-707

Slicing smoked salmon - using fully automated machine with synchronised feeding and slicing action

SAUMON P C 29.06.77-FR-019930

(02.03.79) A22c-25/18

A fillet of smoked salmon is laid upon a support plate which is inclined quite steeply to the horizontal. The longitudinal axis of the fillet lies in a vertical plane and the support plate complete with fillet is reciprocated vertically. The lower end of the fillet overhangs the support plate so that an upstroke of the plate brings the overhang across the cutting edge of a rotary blade. The slice thus detached is delivered by gravity on to a horizontal collecting table.

Before the next upstroke, the fillet is allowed to slide down the support plate to present a new overhang for slicing. The extent of the new overhang is pref. limited by a stop plate just below the rotary blade. The upstroke pref. carries the slice over the top of the stop plate to drop onto the collecting table. Support plate reciprocation is pref. synchronised with fillet feed release for fully automatic operation.

The machine offers high output of slices for commercial distribution. The quality of prod. is at least equal to manual slicing, but the cost is greatly reduced. 29.6.77 as 019930 (19pp448)

GREC ★ D12 26869B/14 ★J5 4026-370

Liquid medicinal food - comprises animal or vegetable protein component digested with hydrochloric acid-pepsin, sugar, emulsified oil and fibrous material

GREEN CROSS CORP 28.07.77-JA-089792

(D13) (27.02.79) A23l-01/34

The medicinal food is composed of (a) 6-8 w/v% of the proteinous component from animal or vegetable foods digested with hydrochloric acid-pepsin, (b) 16-20 w/v% of sugar mixt.-contg. mono-, di-, oligo- and poly-saccharide, (c) 3-5 w/v% of emulsified oil and (d) 0.1-1.0 w/v% of fibrous material.

The food is refrigerated and preserved for application it is heat-melted and can be injected directly in the stomach or the intestine of sick persons with tube through nose. Further the food can be prepared and served germ-freely. The protein is digested with hydrochloric acid-pepsin so that the proportion of proteinous nitrogen on total nitrogen is 40-60%. In sugar mixture promotes absorption and prevents diarrhoea. 28.7.77 as 089792 (3pp5).

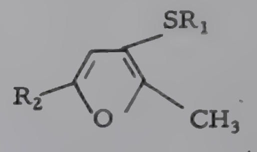
Novel 3-furyl alkyl sulphides are of formula (I) where



(I)

R_1 is 1-5C alkyl and R_2 is H or CH_3.

(I) are used for altering, modifying or enhancing the swee meat flavour of a foodstuff, esp. cpds. where R_2 is H and R_1 is n-propyl or isoamyl. Used in meats, soups, gravies, convenience foods, dog and cat foods etc. Food flavour compsns. contain 2ppm-90 wt.% (I). 18.2.76. as 006320 (12pp963)

MORP ★ D13 26847B/14 ★J5 4026-32

Aminoacid compsn. for treating hepatic encephalopathy - contain l-leucine, l-methionine, l-lysine, l arginine, l-serine, l-tryptopha etc.

MORISHITA PHARM KK 28.07.77-JA-091709

B05 (27.02.79) A61k-09/08

Amino acid fluid supplementation contains L-isoleucin (800 - 1,200 mg/dl); L-leucine (1,300 - 1,600); L-lysine (200 - 500); L-phenylalanine (0 - 100); L-methionine (0 - 200); L-threonine (50 - 250); L-tryptophan (0 - 50); L-valine (800 - 1,200); L-alanine (100 - 300); L-arginine (800 - 1,100); glycine (0 - 300); L-histidine (300 - 500); L-proline (100 - 300); L-serine (100 - 300); L-tyrosine (0 - 50); and L-cysteine (0 - 50)/total, 4,550 - 8,000.

The fluid supplementation is applied as nutrition supplementation to the patient of hepatic encephalopathy which is caused by increase of nitrogen compounds (amin acids, amines, ammonia) depending on decrease of amino acid metabolising capacity in the liver. The compsn. may be administered to the patient via peripheral or central vein together with other fluid supplementation such as electrolyte, glucose or fat emulsion, or vitamins or minerals. 28.7.77 as 091709 (4pp52).

LIOC ★ D13 26858B/14 ★J5 4026-33

Saccharin substitute for oral compsn. e.g. dentifrice - comprise anethole and glycyrrhizic acid salt

LION DENTIFRICE KK 28.07.77-JA-090800

B05 E19 (27.02.79) A61k-07/16

The compsn. has excellent taste and flavour. In prior art compsn. for oral use such as dentifrice, artificial sweeteners such as saccharin, sodium cyclamate, etc. have been used to mask the foreign taste and odour caused fro abrasive, activator, perfume and other additives.

In this invention by using anethole alone or mixt. of anethole and cinnamic aldehyde and/or methylsalicylate as the perfume and glycyrrhizic acid salt as the sweetener together, they show the synergic effect and problems encountered by using them separately, canbe obviated. 28.7.77 as 090800 (7pp5).

SUGY ★ D13 26862B/14 ★J5 4026-34

Protein extn. from defatted soybean - using aq. soln. of mono- or d saccharide, giving high yields at high or low temps.

SUGIYAMA SANGYO KAG 27.07.77-JA-090043

(27.02.79) A23j-01/14

Soybean protein can be extracted efficiently with high yield from defatted soy bean extracted at low or high tem without fall in quality.

Proteins in defatted soy bean are denatured with heat during the extn. and its water-soluble protein content is much lower than that of the soybean. The saccharides are e.g. glucose, fructose, mannose, xylose, maltose, lactose, etc., in an amt. of 1-20 w/w% of the defatted soybean in the form of the aq. 0.02-1 w/w% soln.. 27.7.77 as 090043 (2pp5).

KANE ★ D13 26863B/14 ★J5 4026-350

Seasoned instant fried bean curd prepn. - by combining sugar alcohol and coagulated bean curd, frying, treating with water, impregnating with seasoning soln. etc.

KANEBO KK 26.07.77-JA-090777
(27.02.79) A23l-01/20

Process comprises (a) combining sugar alcohol with coagulating bean curd; (b) frying; (c) treating with hot water to impregnate water and to extract oil; (d) impregnating with seasoning soln.. (e) press-moulding it to remove excessive seasoning soln. and to regulate its form; and (f) drying.

Prod. is storage stable and can be easily restored with hot water to seasoned fried bean cured excellent in texture and taste and flavour without dissolving out of the seasoning solution. Thus it can be used as an ingredient for instant noodles. 26.7.77 as 090777 (4pp5).

KIMU/ ★ D13 26864B/14 ★J5 4026-353

Konjak food contg. vitamin(s) and other nutrients - produced by stirring the mixt. to paste and heat treating to ferment and coagulate

KIMURA K 28.07.77-JA-090826
(D16) (27.02.79) A23l-01/21

The method is to prepare the 'konjak' food containing vitamin A, vitamin Bl, vitamin B2, pantothenic acid, nicotinic acid amide, glutamic acid, glycoside, folic acid, peptide, ester, mineral, etc. by processing refined 'konjak' powder, and comprises (1) combining yeast or enzyme to 'konjak' powder, (2) if necessary, adding seasoning to the mixture, (3) stirring the mixture to paste and (4) heat-treating it properly for ferminting and coagulating.

The solution containing yeast and enzyme is used for preparing 'konjak' food instead of water and 'konjak' food excellent in preservative property and nutritive value can be prepared inexpensively without using additives. The major component of 'konjak' powder, 'konjak' mannan is hydrolysed with enzyme to hexose, alcohol, amine, etc. and delicious 'konjak' food can be obtained. 28.7.77 as 090826 (4pp5).

LOTT ★ D13 26865B/14 ★J5 4026-363

Refrigerated confectionery contg. ice cake - and gelatinous alcohol-contg. sauce which gels on cooling and is obtd. by mixing sugar syrup, polysaccharide, stabiliser and alcohol

LOTTE KK 27.07.77-JA-089983
(27.02.79) A23g-09

The refrigerated confectionery is the combined confectionery composed of the gelatinous alcohol-contg. sauce which is not gelled while it is hot and is gelled by cooling, and ice cake. The gelatinous alcohol-contg. sauce is obtd. by mixing (a) sugar syrup of Bx 40-70, (b) polysaccharide of tamarind seed, (c) $\geqslant 1$ stabiliser selected from the extract of the algae belonging to Gigartinales, gelatin, locust bean gum, gua seed gum, etc and (d) 7-17 w/w% of alcohol.

The sol. sauce can be gelled by cooling it or contacting it with ice cakes and is not frozen to form ice pieces due to freezing point depression through alcohol. The sauce has the freezing point at (-30)-(-35)°C and can keep transparent state under gelled state. It can be put in the vessel with ice cake and gives the flavorous taste and the refreshing feeling specific to alcohol. 27.7.77 as 089983 (2pp5).

YAMS ★ D13 26866B/14 ★J5 4026-366

Extracting sweet substance from Periandra plants - by using water-contg. hydrophilic organic solvent

YAMASA SHOYU KK (HORI-) 27.07.77-JA-089234
B04 (27.02.79) A23l-01/22 C07g-17

Method comprises extracting the underground part of plants belonging to Periandra or the sweet substance obtd. from it (e.g. dry plant body or its powder) with hydrous hydrophilic organic solvent (water content <15%).

Though the sweet substance in Periandra has not been identified, it is quite different from stevioside, glycyrrhizin, etc.. Intensity of its sweetness is almost same as stevioside. The inventor has found that the sweet substance shows large solubility in hydrous hydrophilic organic solvent under acidic condition of pH <3 pref. pH 1-2.5, that the bitter substance is extracted from the Periandra plant together with the sweet substance and that the sweet substance can be sepd. from the bitter substance by neutralising the extract to pH >5 and recovering the ppte. 27.7.77 as 089234 (4pp5).

YAMS ★ D13 26867B/14 ★J5 4026-367

Refining aq. extract of Periandra plant roots - by precipitating the sweet substance by adjusting pH to below 3

YAMASA SHOYU KK (HORI-) 27.07.77-JA-089235
B04 (27.02.79) A23l-01/22 C07g-17

Method comprises forming an aq. soln. contg. a sweet substance, by extracting the roots of the plant of Periandra (e.g. Periandra mediterranea and Periandra dulcis) with water, and precipitating the sweet substance by adjusting the pH to < 3.

The sweet substance of Periandra shows a large solubility in water and mixed solvents of water and a hydrophilic organic solvent (water content >15%) under slightly acidic to alkaline conditions. By adjusting the pH to <3, the sweet substance and various acid-insoluble substance can be co-pptd. and the refined sweet substance can be obtd. by dispersing the ppte. in water, neutralising it to dissolve the ppte. and refining the soln.

Typically the soln. is treated with an ion exchange resin, molecular sieve, adsorbent, etc. or after concentrating it, the concentrate is mixed with a hydrophilic organic solvent to make the water content < 15% to form the ppte. of the sweet substance. If necessary, the refined soln. of the sweet substance is further treated toobtain solid sweet substance by spray-drying, vacuum-drying, freeze-drying, etc.. 27.7.77 as 089235 (3pp5).

COMMERCIAL ORGANIC 19.12.77-US-862220
B03 E13 (20.03.79) C07d-277/64

Prepn. of saccharine comprises (i) sulphonating o-chlorobenzoic acid with Na_2SO_3 in aq. soln. in the presence of a Cu salt, (ii) recovering from the soln. and drying the resultant o-sulphobenzoic acid as an alkali metal salt, (iii) dehydrating the salt to provide o-sulphobenzoic acid endo-anhydride, (iv) reacting this with MeOH, (V) treating the resultant o-sulphobenzoic acid methyl ester with thionyl chloride (as chlorinating agent) in the presence of a catalytic amt. of tert. amide to provide methoxycarbonylbenzene-o-sulphonyl chloride, and (vi) reacting this with NH_4OH followed by acidification.

The improvement comprises salting out the whole of the o-sulphobenzoic acid from the soln. of its salt in the form of potassium-o-carboxybenzene sulphonate by the addn. of HCl and KCl; removing the inorganic salt formed during dehydration of the K salt prior to the chlorination step; and using $\not>$ 2-fold excess of the chlorinating agent.

The process enables the saccharine to be produced in high yield and minimises the possibility of it being contaminated by any known carcinogens. The process does not require the use of a large excess of chlorinating agent. 19.12.77 as 862220 (4pp914)

Urea and fatty acid addn. prod for animal feeds - by spray drying urea-fatty acid mixt. in air stream
NOVENYOLAJIPARI MOS (BUDA) 11.03.75-HU-NO0188 (26.02.76-US-661498)
*C03 (20.03.79) *BE-839-034 A23k-01/22*

Prodn. of a urea-fatty acid adduct comprising discrete solid particles suitable for adjusting urea and fatty acid contents of ruminating animals is described. Process comprises preparing a soln. or melt from urea with 0-45% water at 60-140°C; reacting this with a fatty acid at 60-140°C or a mixt. of liq. fatty acid and neutral fat melted at 35-105°C in wt. ratio of urea (calculated as pure urea) to fatty acid of 40:60-60:40 in a reactor for 2.5-10 seconds; and then spraying the mixt. into a spraying space where the sprayed particles remain in an air stream until they crystallise and settle.

The prod. is free from fillers and is obtd. in dry non-agglomerating form. 2.5.77 as 792561 (9pp945)

QUAKER OATS CO 12.01.78-US-868902 (02.08.76-US-710480)
(20.03.79) A23g-03

Marshmallow compsn. consists of marshmallow low in reducing sugars to which is added before it sets, a cereal m material contg. starch and at least 30 wt.% protein. The cereal is first heated sufficiently to gelatinise the starch and denature the protein, without reducing the nutritional value, and is then coated with fat. 12.1.78 as 868902 (6pp955)

HART- ★ D13 27768B/14 ★US 4145-450
Controlling butterfat content in milk - in response to measurement of sound velocity in milk at two temperatures
HARTEL CORP 22.06.76-US-698782
(20.03.79) A23c-09

The butterfat content of a stream of milk is controlled by adjusting the quantity of cream removed. The butterfat content in the remainder of the milk is determined by forming two substreams of milk which are fed to similar measuring stations. Each station measures the velocity at which a sound wave propogates through the milk. The stations include heaters set to different temp. e.g. 45°C and 65°C.

From these measurements of the velocity of sound at the two known temps. the butterfat concn. can be computed and compared with a preset value. An error signal is generated and used to control the amt. of cream removed from the milk. The appts. adjusts the butterfat concn. of milk to a predetermined value. The appts. operates continuously and discharges milk from the measuring stations back into the milk prod. conduit. 22.6.76 as 698782 (6pp295)

VLEN- ★ D14 25986B/14 ★BE -872-377
Tractor mounted cutter box for blocks of ensilaged material - handles grass and other fibrous material with blades operated by power take/off
MASCH VAN LENGERICH 30.07.71-DT-138186
P12 (16.03.79) A01f A23n

Mechanical cutter and transporter for blocks comprises a tractor mounted frame with horizontal toothed rake fitted to the frame to be driven into the material. Above the rake, the frame carries a silage cutter which is displaceable on the frame and is driven by the power take-off of the tractor.

The silage cutter can be moved vertically up and down the frame and takes the form of a rectangular box section. At least two of the adjacent lower edges of the box section have downward facing cutting tools driven from the power take-off.

Each cutting tool pref. comprises two powered cutting blades reciprocating in opposition. The box section can be moved vertically down to meet the horizontal rake and releasably locked in this relationship.

The frame fits on to the standard three-point linkage of modern, agricultural tractors and is driven from the power take-off. The design is sufficiently robust to cut large, parallelipiped blocks from compact, fibrous, ensilaged material such as grass and beetroot leaves. 29.11.78 as 872377 (13pp448).

Cryogenic immersion freezing plant partic. for food prods. - recycles liq. carbon di:oxide by recompressing exhaust gas
GUILLER J 30.06.77-FR-020178
Q75 (02.03.79) A23l-03/36 F25d-03/10 F25d-17/02 F25d-25/04

Air lock valves are employed as prod. entry and exit for a pressure vessel in which the prod. is immersed in liq. CO_2 under a head space of gaseous CO_2 at a pressure above atmospheric. An elevator is used to lift the prod. from the liq. and deliver it to the exit. Excess gas from the head space is exhausted to a compressor which delivers it to a condenser reservoir from which liq. CO_2 is returned to the pressure vessel.

The air locks are pref. of the rotary or spaced shutter types. The exit pref. comprises two air lock valves in succession with an intermediate decompression space from which gas is pumped back to the headspace. Pressure inside the vessel is pref. about 6 bars and the compressor delivers at a pressure of about 12 bars.

Used for rapid deep freezing of prods. esp. food prods. on an industrial scale. The installation can handle food prods. as complete items, reduced to small pieces or as particles. In partic. particles which previously tended to agglomerate are now frozen as clean, individual particles The installation is inexpensive to buy and economic to operate because the CO_2 is recycled. 30.6.77 as 020178 (12pp448)

Radioactive waste disposal control - by prediction of expected waste yield and controlling number of thickeners
HITACHI KK 09.09.77-JA-107813
K07 (29.03.79) C02c-05 G21f-09/06

The number of operational radioactive waste disposal units e.g. of a nuclear reactor of the boiling water type, is controlled by predicting the amount of waste fluid produced during a given period. The required minimum number of disposal units is calculated on the bases of this prediction and adjusted accordingly.

This facilitates the management of waste disposal, reduces the operating costs of the thickeners and prevents corrosion or crust formation in the thickeners. 5.9.78 as 838677 (30pp39)

DALE/ ★ D15 26470B/14 ★EP ---1-345
Removing salts from aq. soln. - using polyether adsorbed on active carbon
DALE J 19.09.77-NO-003215
A97 (A25) (04.04.79) B01d-15/08 C01b-31/08 C02b-01/14
D/S: E(BE, CH, DT, FR, GB, NL, SW)

Complete, partial or selective removal of salt(s) from aq. soln. is effected by contacting the soln. with active C which is impregnated with a cyclic or linear polyether (I). The ether and salt(s) are eluted successively from the carbon. The active C is impregnated by contact with an aq. soln. of (I).

Pref. an aq. soln. of a mixt. of salts is passed through a column of impregnated C so that the salts are adsorbed to different extents. Pref. (I) is recovered by elution with nonpolar or slightly polar, water-immiscible organic solvent, and the salt(s) then recovered by elution with water.

Adsorbing (I) on active C means that less (I) is required. Process is useful for desalination and purificn. of drinking water from ground water sources since nitrates are firmly retained. Active C is already used for removing organic contaminants from drinking water. Sewage and waste water may also be treated to recover larger amts. of nitrates. Analytical and chromatographic uses are also possible.
14.9.78. as 300384 (15pp949).

Process for the hygienic elimination of sewage with salt-contg. organic substances, comprises conc. by evapn. in a combustion chamber, where the organic substances are burned and the aggregate state of the salts modified. The combustion chamber is of the ''uncooled'' type and requires the replacement of relatively small heat-losses. A waste heat boiler eliminates severe boiler tube corrosion and contamination. The temp. of the combustion chamber is above the salt m.pt. and thus thermally stabl organic cpds. can be reliably oxidised.

A process involving lower operating costs than conventional systems is provided. 28.4.77. as 017861 (6pp1364)

Detector for measuring amt. of oil in water - uses two laser infrare sources and an infrared detector
STANDARD TELEP CABL 25.11.75-GB-048354
H03 J04 R16 (04.04.79) G01n-21/26

An oil-in-water detector for measuring oil pollution leve in water includes twolaser IR sources each operable at a different wavelength between 8000 Å and 9500 Å. The lasers are operable alternately and an IR detector receiv radiation from the sources through the water. The detector is responsive to IR absorption of the light from the lasers due to C-H overtone stretching frequencies of 8000 Å - 9500 Å, the absorption corresp. to the oil conte in the water. The lasers are GaAl arsenide or GaAl phosphite types.

The lasers and detector are pref. coupled to the wate stream via quartz or Si windows, or, for remote operati via fibre optic systems.

Device permits continuous and instantaneous monitori of a moving stream, e.g. an oil tanker water ballast discharge system. 16.11.76.(3pp314)

Single column ion exchange appts. for treatment of liquids - comprising a central liquid feeder between upper and lower ion exchange resin beds

JAPAN ORGANO KK 28.07.77-JA-089815

A91 J01 (26.02.79) B01j-01/06

Appts. for ion exchange of a liq. such as waste water comprises a single column packed with ion exchange resin fillers and provided with liq. collectors such as straighteners in upper and lower sections and a liq. feeder such as distributor in a middle section. Ion exchange resin beds having the same height are formed in upper and lower spaces relative to the liq. feeder, which feeds both beds with the liq. at the same flow rate simultaneously such that an up-flow of liquid is supplied to the upper bed and a down-flow to the lower bed.

The arrangement doubles the treating capacity without increasing installation space requirements. 28.7.77 as 089815 (4pp).

KOBM ★ D15 26624B/14 ★J5 4025-279

Tubular membrane separator for waste water treatment - is cleaned by passing cleaning balls through the separator

KOBE STEEL KK 27.07.77-JA-090762

J01 (26.02.79) B01d-13

A method for cleaning a membrane assembled in a tubular membrane separator for treating dirty and waste waters, using cleaning balls. The object is to avoid clogging of the membrane with dust, thus allowing the separator to be operated continuously for a long time.

The novelty is that a filter is disposed in a cleaning ball passage located behind the separator but in front of structures having narrower passage such as control valves and flow meters. The flow direction of the cleaning balls may be fixed at all times or reversed to the separator. The filter may consist of a straightener having a filter element with approx. 20 to 40 mesh. 27.7.77 as 090762 (4pp26).

MITR ★ D15 26745B/14 ★J5 4026-059

Treating waste washing water - by passing through oil separator sand filter and adsorption carbonate tower

MITSUBISHI RAYON KK 28.07.77-JA-090562

A88 J01 (27.02.79) C02c-05

Waste washing water e.g. resulted from the washing of a car or mould, or from defatting in the pretreatment of coating, cooling appts. etc. is purified and circulated for reuse.

Process comprises (a) passing the water through an oil separator to separate oil component by flotation; (b) passing through a sand filter to remove suspended solids, e.g. earth and sand etc., and (c) passing through an adsorbing tower packed with fine composite material (I). (I) comprises inorganic granules e.g. (hydr)oxides or salts of Mg, Zn, Pb, Fe, Co, Ni and Cu etc., activated charcoal, bone charcoal, coal, silica etc, and an organic polymer, e.g. co- or homo-polymers of styrene, MMA, ethyl acrylate, ethylene , propylene, acrylonitrile, vinyl acetate, butadiene etc., polyurethane, polysulphone, polycarbonate etc..

Usage of washing water is reduced and the amt. of a surfactant to be added during washing is reduced. 28.7.77 as 090562 (4pp34).

DAIZ ★ D15 26746B/14 ★J5 4026-060

Treatment of soln. contg. organic reductant e.g. hydrazine - by adding e.g. hydrogen peroxide and contacting with oxygen in the presence of a metal or metal salt

DAIDO TOKUSHOKO KK 29.07.77-JA-091691

E19 (27.02.79) C02c-05/04

Organic reducing substances, e.g. hydrazine, formic acid, oxalic acid etc. are rapidly and smoothly removed by oxidn. decomposition from its soln. contg. by adding H_2O_2 or a H_2O_2-generating substance, e.g. NaS_2O_8 $(NH_4)_2S_2O_8$, $K_2S_2O_8$ and Na perborate, etc., and subsequently contacting it with an O_2(-contg.) gas in the presence of a metal, e.g. Fe, Co, Ni etc., or its salt, oxide or hydroxide.

Hydrazine is in contact with O_2 generated from H_2O_2 or the H_2O_2-generating substance, and decomposed by oxidn. into N_2 and H_2O. When the metal is used in form of hydroxide or salt, it is deposited as oxide in contact with O_2 and a portion of the oxide, e.g. Fe oxide causes hydrazine to decompose. 29.7.77 as 091691 (3pp34).

ehydrating sludge formed from slaughterhouse waste blood water by mixing the sludge with active sludge obtd. in treatment of other laughterhouse effluents, adding aggregating agent and ehydrating
TOHO RAYON LTD 03.08.77-JA-093145
(D12) (28.02.79) B01j-01 C02c-03

Method comprises heating the waste blood water at 50 - 100°C to obtain a waste blood sludge, mixing this sludge with an active sludge by-produced in treatment of various waste waters exhausted from the slaughterhouse to obtain a mixed sludge, adding an aggregating agent to the mixed sludge, and then dehydrating the resulting mixt..

In an example, waste blood water exhausted from a slaughterhouse was heated at 85°C for 10 min. to obtain a waste blood sludge of 1.7% sludge concentration. The BOD of the waste blood water was 21,000 ppm. The waste blood sludge was mixed with an active sludge of 1.0% sludge concentration to obtain a mixed sludge. 0.25 % of a polymer type aggregating agent was added to the mixed sludge. The resulting mixt. was filtered with a nylon net of 80 mesh, and pressed under high pressure to obtain dehydrated filter cake. 3.8.77 as 093145 (3pp).

ORA ★ D15 27062B/14 ★J5 4027-018
ibrous adsorbent used e.g. for water purificn. - prepd. from water nsol. inorganic powder and water insol. hydrophilic polymer
TORAY INDS INC 29.07.77-JA-090271
A94 F01 (A14) (01.03.79) D01f-01/10

The adsorbent is composed of (a) 50 - 93 wt.% of water-insol. inorganic powder having adsorption activity and (b) 50 - 7 wt.% of water-insol. and hydrophilic polymer, and contg 0.4 - 4 pts. (per 1 pt. of the inorganic powder) of combined water.

The adsorbent is used for removal of impurities from water, etc. The adsorbent combines sufficiently large contact area (essential to higher adsorption rates) with improved mechanical strength. In an example, a soln. of 100 pts.wt. of acrylic copolymer (acrylonitrile 96.2% + methyl acrylate 3.8%), 300 pts.wt. of natural zeolite, and 933 pts.wt. of DMSO contained in a dope tank was supplied to a nozzle. 50 wt.% aq. DMSO soln. held in a coagulating liquor tank was also forwarded to the nozzle by compressed N_2. The nozzle has a circular slit for the dope and a smaller orifice for the coagulating liquor, and the resulting filament has macaroni-shaped structure. 29.7.77 as 090271 (13pp173).

MITR ★ D15 27063B/14 ★J5 4027-019
Oil absorbent material for waste water treatment - made from an aggregation of fibrillated fibre prepd. by dispersing oil adsorbent fibre in air and applying shearing force
MITSUBISHI RAYON KK 28.07.77-JA-090561
A94 F01 J01 (01.03.79) D01d-01 D01f-06

The material is made from an aggregation of fibrilated fibre which in turn is prepd. by (1) dispersing oil-absorbing fibre in air and (2) applying shearing force to the said dispersion to form fine fibrils on the surface of the fibre particles.

The oil-absorbent material (in the form of loose fibre aggregation, mat, sheet, etc.) is used for filtering waste water to remove suspended oily solids. The fibrilated fibre particles have greater surface area and improved filtration capacity.

In an example 20 d, 12 mm polypropylene staples were dispersed in water to prepare 5 g/ltr slurry. The slurry was stirred and filtered with a 60 mesh stainless steel screen to obtain the aggregation of fibrilated polypropylene staples. 60 g of the fibre aggregation was packed in a column. Filtration of a model water sample containing 100 ppm of dispersed oil with the column gave of the oil. 28.7.77 as 090561 (3pp173).

KURS ★ D15 27069B/14 ★J5 4027-025
PVA-based hollow filament membrane prodn. - by spinning soln. through circular slit with introduction of gas to coagulate inner wall
KURARAY KK 01.08.77-JA-092839
A14 F01 J01 (A32) (01.03.79) D01d-05/24 D01f-06/14

Method comprises extruding the spinning soln. through a circular slit, wherein gas contg. gaseous coagulating material for the PVA-based filament (e.g., NH_3 gas, acetone vapour, etc.) is introduced into the interior of the tubular filament to effect coagulation of the wall of the hollow filament.

The process gives a hollow filament having improved uniformity of wall thickness and completely circular cross-section. Because of the very high water permeability, the resulting PVA-based hollow filament is useful in ultrafiltration, reverse osmosis, etc.. 1.8.77 as 092839 (4pp173).

NITA- ★ D15 27118B/14 ★J5 4027-255
Treating high BOD waste water from food processing - by aerating under fluidised state in presence of coal or activated charcoal to which microorganisms are adhered
NIPPON TANSUI KOGYO 30.07.77-JA-091647
(01.03.79) C02c-01/06

A waste water having very high BOD content, i.e. 300 to 30,000 ppm e.g. discharged from beans paste-producing factory, Miso (soybean paste)-producing plant and marine products-processing factory etc. is purified to lower its BOD content while suppressing largely generation of surplus sludge without any dilution with H_2O.

Method comprises aerating under fluidised state the waste water in an aeration vessel while fluidising coal (except peat, bituminius coal having carbon >than 84% and anthracite) or activated charcoal, having the granular distribution as follows, a fraction of granular size of 2 to 5 mm being > 80% and a fraction having difference in granular size of 0 to 0.5 mm being < 70%. The fluidised coal or activated charcoal was adhered with microorganisms, e.g. alc.-fermentation bacteria etc..

The amt. of coal to be used is 5 to 25 kg/m^3 in the aeration vessel, and the higher the BOD concn. of the waste water to be treated, the higher the content of the coal or activated charcoal having greater granular size. 30.7.77 as 091647 (6pp34).

ASAG ★ D15 27119B/14 ★J5 4027-256

Waste water treatment - using double polar electrolysing appts.
TDK ELECTRONICS KK 02.08.77-JA-092884
J03 (01.03.79) C02c-05/12

In the purification of waste water e.g. industrial or domestic waste water, by the use of a double polar electrolysing appts. in which electroconductive granules, e.g. ferrite are filled between a pair of main electrodes, the improvement comprises (i) providing separately a separating region (A) and an electrolysing region (B); (ii) treating waste water subjected to coagulation treatment at the sepg. region with a detonating gas (sic)-contg. water sent from the electrolysing region to form scum which is discharged by flotation to the outside, and (iii) sending a portion of an aq. phase sepd. from the scum to the electrolysing region where is formed by electrolysis a detonating gas which is mixed with remaining water and sent to the sepg. region as the detonating gas-contg. water.

Contamination of the electrodes is decreased, and electrolysing efficiency is improved. Maintainance and control are simplified since washing treatment is facilitated. 2.8.77 as 092884 (3pp34).

TOHS ★ D15 27123B/14 ★J5 4027-260
Treating blood-contg. waste water from slaughterhouse - by allowing the water to stand and heating to coagulate the dissolved blood
TOHO RAYON LTD 03.08.77-JA-093146
(D12) (01.03.79) C02c-05

Waste water has its BODand COD values lowered (removability : > 90%) by standing for a few hrs. at 10 - 50°C, and subsequently heating at 50 - 100°C to coagulate the dissolved blood component as millet- or red bean-like solids which are then easily and effectively sepd. from the water by settling, flotation or filtration, etc..

The water thus treated has very low nitrogen content and is effectively discoloured, so it can be run-off without any contamination. The wasted solids (sludge) are dewatered and dried, and used as feed or fertiliser. 3.8.77 as 093146 (3pp34).

**Ground or surface water distillation - using pump to reduce sy
pressure and solar collector for heat with auxiliary heat sourc
electrical control system**
VAN GEEST C H J 19.09.77-NL-010273
(21.03.79) B01d-01 B01d-03 C02b-01/04

Ground or surface water is distilled using an evaporator, a condensor, a distilled water reservoir and a pump for drawing a vacuum in the condensor and eavaporator. The raw water enters the cooling side of the condensor passes to the evaporator and thence into the hot side of the condensor. It is then passed via the suction pump to the reservoir. The evaporator consists of two alternative heat sources one of which is a solar energy collector, the second being a heater of the conventional type which makes up the energy defficiency required to evaporate the water after it has passed through the solar collector.

Pref. the auxiliary heat source is on a separate closed circuit, the heat passing from the heating fluid to the raw water via a calorifier type heat exchanger. This system incorporates an electrical control system for regulating the heat input of the auxiliary heater in accordance with the availability of solar heat and also the level in the calorifier/evaporator.

The use of the vacuum pump and solar energy collector minimises the energy required for distn. 19.9.77 as 010273 (9pp1370)

Removing fluorine from natural water by rapid electrolysis - at soluble duralumin electrodes to eliminate rise in electrode voltage and soln. temp.

KISH POLY 10.10.72-SU-836510
E36 J03 (20.04.78) C02b-01/82

The degree of defluorination of natural water can be increased and the time taken for the process reduced from several hr. to less than 15 min. if the electrolysis treatment is carried out at duralumin electrodes instead of aluminium, using a current density of 23-25 m./cm^2. The hydrogen given off during electrolysis floats the flakes formed on the surface of the electrodes on which the fluorine is deposited, and sepn. of the foam occurs continuously The modified process prevents a rise in electrode voltage of 10-15 times, and also prevents a rise of temp. of the treated water to 70°C, which occurred with aluminium electrodes and reduced the stability of electrolysis. Selective removal of chromate, Cr and Zn ions from H_2O contg. total dissolved solids as total hardness of 100-1500 ppm (as $CaCO_3$) consists of the treatment of the H_2O with a weakly basic anion exchange resin (I) (SO_4 or Cl orm), then with a weakly acidic cation exchange resin (II) Na form).

Method effectively controls Cr^{6+} as well as Zn and Cr^{3+} evels in industrial waters, etc. partic. cooling tower blowdown where Cr and Zn cpds. are used as corrosion inhibitors. In addn., the resins used are resistant to oxidn. and fouling. 20.12.76 as 752334 (6pp478)

Removing fluoride from waste water by adding calcium and phosphate - and precipitating germs of fluor:apatite or calcium fluoride

ANDCO IND INC 24.01.77-US-761685

*(20.03.79) *BE-863-227 C02b-01/20*

A continuous process for purifying water contg. fluoride comprises continuously adding calcium compsn. to a stream of water to provide ≥ 5 moles of available calcium per mole fluoride; and continously adding phosphate compsn. to the stream to pH 6-11.5 after addn.

Simultaneously with the phosphate addition, a seeding compsn. is slurried contg. fluoroapatite, calcium fluoride and their mixts.; and a ppte. is permitted to form contg. all fluoride present. Pref. sufficient phosphate compsn. is added to provide ≥ 3 mole of available phosphate per mole fluoride.

Used esp. for reducing fluoride content of waste water from mfr. of phosphates, fluoborates, fluorides, fluorine and fluorosilicate. 24.1.77 as 761685 (7pp931)

FARH D15 44075A/25 = US 4145-283

Purifying aq. liquor from caustic fusion of arylsulphonic acids - by oxidising with oxygen or oxygen-contg. gas at high temp. under pressure

HOECHST AG 16.12.76-DT-657011

*E14 (20.03.79) *BE-861-944 C02c-05/04*

Waste water obtd. during the prepn. of a hydroxy aromatic by caustic alkaline melt of aryl sulphonic acid or aryl sulphonate to form a molten prod. is purified by dissolving the molten prod. in water or aq. saline soln. The strongly alkaline liquor obtd. is neutralised with SO_2 or H_2SO_4 and any precipitating salts and the hydroxy aromatic are sepd. from the neutralised waste water. Neutralised water is the subject of wet oxidn. with oxygen (contg. gas) at 100-370°C at 1-300 bars pressure.

Waste water formed on prepn. of e.g. resorcinol and beta-naphthol is purified by wet oxidn. The COD-decomposition rates are $\geq 90\%$. 14.12.77 as 860374 (5pp931)

BERE/ ★ D15 27699B/14 ★US 4145-286

Removing hydrocarbon(s) from water automatically - by passing water into a chamber where hydrocarbon s) settle out and are pumped out when oil level reaches a predetermined level

BERESKIN F P 01.08.77-US-820553

J01 P41 (20.03.79) B01d-21/24 B03d-03

An automatic system for the removal of waste hydrocarbons from water has the waste water entering a primary vessel through a baffled inlet chamber, allowing solids to fall to the bottom of a main collection chamber as the waste hydrocarbons float upwardly on the water in the chamber. The separated water flows out of the chamber into a sewer system.

When the oil level reaches a predetermined level a sensor system allows water to enter the bottom of the main collection chamber whilst closing off the water discharge outlet. The hydrocarbon level is forced upwardly until gravity forces them out of the waste discharge outlet into a storage vessel. When the waste is discharged, normal waste water flow-through is resumed. Upon filling the storage vessel, all operations are suspended until the stored hydrocarbons are pumped out. 1.8.77 as 820553 (6pp1345)

WALK/ ★ D15 27700B/14 ★US 4145-287

Recovering grease from waste effluent water - by gravity separation in tank with siphon removal of water

WALKER H L 17.01.77-US-760095

(20.03.79) B01d-21/24

Waste effluent contg. a mixt. of grease and water is received in a sump. A pump removes the effluent from the sump and transfers it to a separator tank in which the grease fraction floats on the water fraction. The sump includes a level sensor which actuates the sump pump until the sump liquid level has fallen to a lower level.

A siphon dips into the water fraction and discharges water when a predetermined liquid level is present in the separator tank. Discharge of the water via the siphon continues until a predetermined lower level is reached. The siphon comprises a vertical tube with an air inlet adjacent a T-coupling at its upper end.

The appts. recovers grease from waste effluent from a restaurant prior to discharge into a municipal sewer. 17.1.77 as 760095 (11pp295)

Water dispenser with inverted storage bottle - discharging through porous ceramic capsule contg. dispersed metallic silver

FOREMOST-MCKESSON 07.09.77-US-831262 (27.06.76-US-726762)

Q39 (20.03.79) B67d-03 C02b-03/10

Water dispenser comprises an inverted container of water whose neck is received in the top of a storage tank. Where the neck enters the storage tank a basket supports a ceramic capsule with a central aperture and ribs which intercept the flow of water from the container to the tank. The capsule is porous and is below the liq. level of the storage tank when full.

Metallic Ag is dispersed within the porous ceramic capsule and is thus contacted by water during filling of the tank and during storage. Tests showed that the capsule controlled the growth of bacteria in the storage tank.

Appts. dispenses water and controls the growth of bacteria during storage. The capsule requires replacing once a year. 7.9.77 as 831262 (6pp295)

onascus dyestuffs soln. having high chromaticity - is obtd. from onascus fungal strain using aq. alcohol soln. contg. e.g. sodium hloride

MITSUBISHI RAYON KK 29.07.77-JA-091893

E24 (27.02.79) C09b-61

Dyestuffs are extd. from Monascus strain fungi or their oji using an aq. soln. of alcohol contg. salt. The process s efficient and gives good yield. The resulting dyestuff soln. has high chromaticity and good storability.

Monascus fungi such as Monascus purpureus, Monascus major and their cultures and koji grown on substrates such as starch, glucose, rice, flour, bread, ethanol etc. are used. The soln. used as extractant contains ≥1 of methanol, ethanol, propanol, isopropanol, propylene glycol, glycerine etc. at a concn. of 20 - 90%. The salt is sodium chloride, potassium chloride, calcium chloride etc. at a concn. 0.5 wt.% up to its saturation. The pH is 3 - 12 and the liq. temp. is 0 - 100°C.

In an example rice koji was prepd. using Monascus No. 1001 fungus and it was dried and powdered. To 1 g of the powder were added 20 ml. of 50% ethanol contg. 9% NaCl and the dyestuff was extd. by stirring at room temp. for 2 hrs. The extract was diluted 150 times and the absorbance at 500 µm was found to be 0.331, compared with 0.256 for a control not contg. NaCl. 29.7.77 as 091893 (3pp119).

Fixing an enzyme on a solid surface - by reacting reagent with gps. capable of reacting amino gp. with poly-amine to form film on surface and reacting amino gp. with enzyme
UN'TIKA KK 29.07.77-JA-092069
A96 B04 (27.02.79) C07g-07/02

Method for fixing an enzyme on the surface of a solid material comprises reacting a reagent with $\geqslant 2$ functional gps. capable of reacting an amino group with a polyamine to form a film of the reaction prod. on the surface and reacting a remaining amino group of the film with an enzyme.

The solid to which the enzyme is fixed is pref. glass, kaolinite, bentonite, rubber, cellulose, dextrin, polystyrene, polyamides, polyesters, etc.. The reagent with $\geqslant 2$ functional groups capable of reacting an amino group is pref. glutaraldehyde, terephthalaldehyde, isophthalaldehyde, dialdehyde starch, hexamethylenediisocyanate, etc.. The polyamide is pref. ethylenediamine, hexamethylenediamine, diethylenetriamine, polyethyleneimine, etc..

The method is useful for recovering enzymes or stabilising enzymes. It is also useful for a continuous enzymatic reaction. 29.7.77 as 092069 (4pp16).

AJIN ★ D16 26874B/14 ★J5 4026-395
Fermentative prodn. of L-lactate dehydrogenase - by culturing suitable Bacillus strains under aerobic conditions
AJINOMOTO KK 26.07.77-JA-089400
B04 (27.02.79) C12d-13/10

Prodn. of L-lactate dehydrogenase comprises cultivating a suitable strain belonging to the Genus Bacillus and recovering the accumulated enzyme.

Previously the source of L-lactate dehydrogenase has been limited to animal tissues. The fermentative process for producing the same facilitates the prodn. at a lower price.

Suitable microorganisms are Bacillus subtilis Ferm-P 4092, B. blevis ATCC 8185 and B. cereus Ferm-P 4093. The cultivation is carried out at 25 to 40°C for 1 to 3 days under aerobic conditions. The pH of the medium is kept at 6.0 to 8.5 during the cultivation. 26.7.77 as 089400 (3pp16).

KYOW ★ D16 26875B/14 ★J5 4026-396
Malate dehydrogenase for use in liver function diagnosis - is isolated from microorganisms of Corynbacterium, Brevibacterium or Arthrobacter
KYOWA FERMENTATION KK 28.07.77-JA-089791
A96 B04 (27.02.79) C07g-07/02 C12d-13/10

The malate dehydrogenase has the following characteristics: (1) km value to oxalacetic acid $< 2 \times 10^{-5}$M; (2) it acts as a catalyst of the reaction: oxalacetic acid + NADH + $H \longrightarrow$ L-malic acid + NAD^{+}; (3) substrate specificity: oxalacetic acid and L-malic acid; (4) optimal pH at 25°C for 1 minute: 8.5-9.0 for converting oxalacetic acid to L-malic acid and 10.1 for converting L-malic acid to oxalacetic acid; (5) stability: stable at pH 6 to 9 in 0.1 M phosphate buffer at room temp. for 60 minutes; (6) thermostability: stable at 35°C for 15 minutes in a medium of pH 7.4; (7) remaining activity when treated for 15 minutes at pH 7.4: 60% at 40°C, 8% at 50°C and 0% at 55°C; (8) mol.wt.: 60,000 by gel filtration with Sephadex G-100, and 39,000 by electrophoresis with SDS-polyacrylamide gel; (9) isoelectric point: 4.1. 28.7.77 as 089791 (5pp16).

(D13) (20.03.79) A23k-01

Protein-contg. feeds are prepd. by converting a 1-4C hydrocarbon in a CO_2-utilising process to give a MeOH-contg. stream. This acts as C and energy source in a culture with a MeOH-utilising micro-organism, with O_2-contg. gas to maintain aerobic conditions. N-sources, nutrients and are also provided. A prod. stream contg. single cell protein and an off-gas stream comprising CO_2 and unused O_2. The off-gas stream is sepd. into CO_2 (for recycling) and O_2-contg. gas (also for recyling).

Air is sepd. into O_2 and N_2 streams. The O_2 is used for the aerobic cultivation process, and the N_2 is reacted with H_2 to form NH_3, which is fed to the culture medium as N source. The prod. stream, opt. after dewatering, is mixed with supplementary feed components to give a high-protein feed prod.

Integrated system for prodn. of low-cost single cell proteins for man and animals. Reuse of all effluents avoids environmental problems. By-prod. urea for fertiliser use may be formed. 10. 9. 76 as 722196 (10pp1248)

Novel modified protein compsns. prepn. - by reforming using plastein rich in cysteine

FUJI OIL KK 04.04.75-JA-041599

*(D13) (20.03.79) *J51115-500 +A23j-03*

Protein compsn. is prepd. by mixing a cysteine-enriched plastein contg. $\geqslant$5 wt.% half-cystine with plant seed, cow milk, animal meat, fish meat, egg or microorganism protein, in ratio such that plastein is $\geqslant$1 wt.% w.r.t. protein. The resultant mixt. is dissolved or dispersed in water and heated to 40-90°C, to promote the gellation or foaming property of such protein.

Plastein is used in the fields of nutrients and medicines due to its ability to incorporate various amino acids into reconstituted plastein, or by elimination of amino acids from it. 5. 4. 76 as 673885 (6pp931)

Pyridine di:carboxylic acid prepn. from di:methyl pyridine - by oxidn. with chromium salts and hydrolysis of intermediate formed
STOPPANI L SPA 01.12.77-IT-030272
A41 E13 G06 (A60 E31) (16.03.79) C07d

The two-stage process comprises (a) the homogeneous phase reaction at 70-115 (80-110)°C; of a soln. of 2,6-dimethylpyridine in 50-80, (60-70)% H_2SO_4 - such that after the oxidn. reaction, there are present 3-20 (6-10) mols. free acid/mol. dipicolinic acid formed, and a soln. of soluble salt of Cr (VI) of concn. as CrO_3, 40-65 (45-50) %, in 10-100%, pref. 20-50% w.r.t. the stoichiometric amt..

The two reactants are admixed over 2-3 hrs. and the reaction itself is effected for 3-0.5 (2-1) hrs., depending on the temp., By elimination of 1 mol. water, there is formed a novel intermediate addition cpd. (I) between 2,6-pyridine dicarboxylic acid and chromic anhydride, which has the formula: $C_7H_3O_4N.CrO_3$ (I). The reaction mass is cooled, centrifuged and the separated solid washed.

In the second stage (b), the cpd. (I) is hydrolysed at 100-50 (100-80)°C; with water in amt. 5-15 (9-11) times the wt. of the dry solid, in the presence of 6.7 of CrO_3 in the hydrolysis liq., for 0.5-4 hrs, pref. 1-2 hrs. The mixture is then cooled to ppte. the 2,6-pyridine carboxylic acid, which is then centrifuged, dr and recrystallised from water.

The acid is obtained in 99.5% purity. It is used as a organic synthesis intermediate and starting material; a a monomer for the synthesis of polyester and polyamid polymers; stabiliser for peroxides and peracids; in

lishing solns. for metals; as sequestrant; stabiliser for
oxy resins and photographic solns. and emulsions. A
mplex salt of trivalent Cr is obtained as a by-product,
eful in better tanning. 30.11.78 as 872394 (16pp004).

where Z is a mercapto- or sulpho gp. in free form or s an alkali- or alkaline earth metal salt; x is integer 2-6; is H or lower alkyl; R' is H, lower hydroxyalkyl, 1-18C lkyl or ≤18C alkenyl; R" is H, lower hydroxyalkyl or which they are linked, form a 6-membered ring opt. contg. an O or N atoms as additional heteroatom; M is H, alkali metal- or ½ alkaline earth metal atom; D is -NR-$(CH_2)_x$-Z, -NR'R" or -OM; m is integer ≠0 and p and q are integers including O, provided sum m+p+q is 15-500).

Prepn. of (I) and a new process for the quantitative prepn. of light-coloured polydehydroaspartic acid, used as starting material, are also claimed.

(I) are used in cosmetic hair-treatment compsns. pref. in 0.1-10 wt.% concn. The compsns. are used as shampoos waving-, rinsing-, non-rising wave strengthener-, re-structurising- or setting lotions, as dye compsns. or vehicles or as capillary creams. 13.9.78 as 839869 (33pp)

ICIL ★ D21 26394B/14 ★DT 2840-274
Extruder for high-friction pastes for mfr. of dental fillings - has barrel lined with exchangeable PTFE, polyethylene, polypropylene or nylon film
IMPERIAL CHEM INDS LTD 19.09.77-GB-038878
A32 Q31 (A88) (29.03.79) B65b-03/12

Extruder for frictional pastes e.g. compsns. of polymerisable material contg. ≥50 wt.% finely ground glass such as are used for dental fillings, comprises a barrel covered at 1 end and a piston inside it, the cover having an extrusion orifice. The bore of the barrel has a plastics, exchangeable lining comprising a tubular portion closely hugging the bore; a 1st disc with an opening not larger than the extrusion orifice and closing the tubular portion near the cover; and a displaceable 2nd disc in front of the piston.

The replaceable lining minimises cost of wear and tear of the extruder as a whole thus extending substantially the useful service life of the equipment. 15.9.78 as 840274 (13pp267)

ALES/ ★ D21 26487B/14 ★FR 2395-750
Toilet prod. for the hair and scalp - comprises three compsns. of natural prod. extracts successively applied
ALESSANDRI A R 29.06.77-FR-020725
(02.03.79) A61k-07/06

Toilet prod. for capilliary usage comprises several compsns. each constituted by a mixt. of natural extracts in soln. in an appropriate support. The compsns. which are applied successively are (1) an alcoholic soln.; (2) an aq. soln. and (3) a compsn. diluted in a neutral oil. After application, a lightly detergent soln. is applied followed by rinsing with an acid soln.

Each compsn. has complementary effect keeping the hair plentiful, supple and shiny. 29.6.77 as 020725 (7pp)

GODE/ ★ D21 26488B/14 ★FR 2395-756
Lotion for promoting hair growth - contains plasma from blood of animal previously injected with specified emulsion
GODEFROY L G 28.06.77-FR-020711
(02.03.79) A61k-39

The lotion consists of a diluted plasma obtd. by removal of blood from an animal, of the same Foresman gp. as man, which has been injected with an emulsion prepd. with pigs skin and partic. with the layer of basal cells. The emulsion for injection is pref. obtd. by splitting up the layer of basal cells of pigs skin into a physiologically isotonic soln. at 1 pt. skin/100 pts. soln.

The lotion is used to treat baldness conditions which are resistant to known treatments. If the papilla are not totally destroyed, pigmented hair regrows after 5-6 weeks, whereas known treatments only give a colourless down. 28.6.77 as 020711 (6pp597)

WARN ★ D21 26559B/14 ★GB 2004-466
Prosthetic denture - where lateral posterior prosthetic tooth locations can be altered to approximate patients residual gum ridge
WARNER-LAMBERT CO 21.09.77-US-835143
A96 P32 (04.04.79) A61c-13

The denture comprises a segmented hard base structure of configuration conforming to human mandibular or maxillary ridges. Each segment is of hard rigid material (hard acrylic plastics). The segments are joined in such a way that they can be laterally adjusted relative to each other.

Prosthetic teeth are disposed about and bonded to the lower portion of each segment, the teeth being shaped and positioned on the base structure so as to simulate human natural dentition. A deflectable tray layer (pref. of thermo-deflectable acrylic plastics) is bonded to the base and can be moulded to the oral contours during fitting. The segmented base may be laterally adjusted during fitting to align the prosthetic teeth with the mandibular or maxillary ridges. 19.9.78 as 037316 (10pp992)

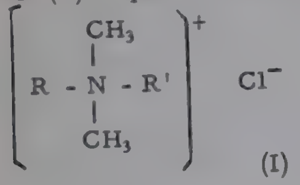
A96 E19 (27.02.79) A61k-07/06 C11d-01/62 C11d-03/04 C11d-09/02 C11d-10

Two layer-type liq. shampoo contains $\geq$ 1 higher fatty acid ester of mannitol, pentaerythritol and/or sucrose; and (b) a quat. ammonium salt of formula (I).



$$\left[R-\overset{CH_3}{\underset{CH_3}{N}}-R' \right]^+ Cl^- \quad (I)$$

In (I) R is 6-17C alkyl or alkenyl group, R' is benzyl, 4-nitrobenzyl, 3,4-dichlorobenzyl, 2-chlorobenzyl, 4-chlorobenzyl, 2,4-dichlorobenzyl, isomeric trichlorobenzyl, (m)ethylbenzyl, dimethylbenzyl, 2,4-dimethylbenzyl, 3,4-dimethylbenzyl, or methyl.

Compsn. further comprises NaCl, polyhydric alcohol, liq. or pasty hydrocarbon, animal or vegetable oil, ethyl alcohol, potassium salt of a higher fatty acid, and water. 29.7.77 as 091554 (9pp126).

KIMI- ★ D21 26752B/14 ★J5 4026-092
Japanese gelatin dental impression material - contg. water soluble salt of alginic acid
KIMIZU KAGAKU KENKY 29.07.77-JA-092089
A96 P32 (27.02.79) A61c-09

3.0 - 35 wt.% of water-soluble salt of alginic acid is added to Japanese gelatine impression compsn.. The impression material is used for dental treatment. It is possible to perform combined impression of Japanese gelatine impression material and alginic acid impression material without impairing accuracy of the Japanese gelatine impression material.

Specifically, 3 - 35 wt.% of sodium alginate or potassium alginate is added to common Japanese gelatine impression material consisting of 55 pts.wt. of Japanese gelatine, 55g of zinc oxide, 2 pts.wt. of cellulose acetate, 3 pts.wt. of HgS or a small amount of menthol. 29.7.77 as 092089 (2pp86).

KANE ★ D21 26856B/14 ★J5 4026-336
Basic cosmetic compsn. e.g. face lotion - contains a powdered zeolite to prevent oxidative degradation of oils and vitamin/A
KANEBO KK 31.07.77-JA-092344
E33 (27.02.79) A61k-07

Basic cosmetic compsn. (e.g. face lotion, cream, milk lotion, etc.) contains 0.5-50 (1-20) w/w% of fine powdery zeolite. Zeolite is the fine powder of alkali(ne earth) metal salt of hydrous aluminosilicic acid and is of formula $(RO)_w(Al_2O_3)_x(SiO_2)_y(H_2O)_z$ (where R is the metal, and w, x, y, z are positive integers).

By combining zeolite in the cosmetic comspn. the odorous organic components and fine metallic ions originated from starting materials can be easily adsorbed on zeolite and the oxidn.-degradation of oily components and vitamin A can be prevented. Zeolite can be stably dispersed in the compsn. without caking and the cosmetics are not only excellent in preservative property, deodourising activity and adhesive property, but also smoothen skin. 31.7.77 as 092344 (6pp5).

KANE ★ D21 26857B/14 ★J5 4026-337
Water-in-oil cream or milk lotion - contg. glycerine, di:glycery mono-or di:oleate, oil and water
KANEBO KK 28.07.77-JA-090973
E17 (27.02.79) A61k-07

Objective W/O type cream or milk lotion composition contains (a) glycerin, (b) diglyceryl-mono-oleate and/or diglyceryl-di-oleate, (c) liquid oil and (d) water.

The cosmetic composition is excellent in preservative stability, mechanical stability, homogeneity, appearance and affinity to skin and can give refreshing feeling at its application. It is not sticky and can be prepared inexpensively. Those desirable effects are caused by the application of glycerin and diglyceryl-mono-oleate and/or diglyceryl-di-oleate and through their effect the water content in the composition can be increased. 28.7.77 as 090973 (7pp5).

KAWA- ★ D21 26859B/14 ★J5 4026-34
Nail lacquer remover - contg. acid amide cpd. as effectiv component
KAWAKEN FINE CHEM K (FUJC) 29.07.77-JA-090988
E19 (27.02.79) A61k-07/04

Nail lacquer remover contains acid amide cpd. (I) as the essential ingredient. (I) is a good solvent for nitrocellulose, the major component of nail lacquer and is non-flammable safe liquid. By combining oil and fat and wetting agent in the nail lacquer remover nutrients can be gi en to nails and the damage of nails by the remover can b prevented.

Pref. (I) include 1,3-dialkyl-2-imidazolidinone (where alkyl is (m)ethyl or propyl). Though the remover can be used in the form of soln. it can also be used in th form of emulsion obtd. by combining fatty acid salt and nonionic surfactant in the liquid nail lacquer remover. 29.7.77 as 090988 (6pp5).

GYUN- ★ D21 26903B/14 ★J5 4026-8
Pearl white soap having grain-like pattern - produced from mi contg. sodium iso:oleate
GYUNYU SEKKENKYOS 01.08.77-JA-092879
E17 (D24) (28.02.79) C11d-13

The process comprises blending a plain soap contg. 1 - 15 % of sodium isooleate with 0 - 2 % of a transparency improver (an agent providing the soap with transparenc e.g., propylene glycol, glycerine, cane sugar, sorbit, etc.), a pearl-whitener (an agent for providing pearl-like gloss by its orientation, e.g., rutile, fish scale, bismuth oxochloride, etc.) and opt. perfume, dyestuffs etc; enhancing the orientation of the whitener by passin through a multi-stage kneader attached with a grating in each stage; extruding the soap compsn., and stampin it into any desired shape with wooden grain-like pattern

Typically 93.7% of plain soap, 5% of sodium isooleat 0.3% of rutile, a dyestuff, perfume and ethanol in a tota amt. of 0.5% and 0.5% of propylene glycol are mixed, stirred in a mixer thoroughly and charged in a 4-stage kneader. The extrudate is stamped into shaped soap ha ing wooden grain pattern.

The process can provide shaped products of pearl-white soap of wooden grain pattern continuously by sim kneading to that for conventional mechanically kneaded soap. The inclusion of sodium isooleate can reduce the amt. of the transparency improver and provides conver iently the orientation of the pearl-whitener. 1.8.77 as 092879 (7pp59).

Composite absorbing member for surgical use - comprising porous film, liq. diffusing flaky substance and liq. absorbing pad detachably adhered

NITTO ELECTRIC IND KK 29.07.77-JA-091710
A96 F07 P32 (27.02.79) A61f-13/20

A composite absorbing member comprises a porous film, a liq. diffusing flaky substance and a liquid-absorbing pad detachably adhered on each other. The liquid-diffusing flaky substance has liq. absorptivity greater than that of the liquid-absorbing pad and a liq. retaining properties less than that of the liq.-absorbing pad.

Composite absorbing member is used for surgical treatment. It is possible to cure the opening of a wound without injuring the cuticle of the wound because only a liquid-absorbing pad or a liquid-diffusing substance are peeled off while a porous film is left on the opening of the wound. 29.7.77 as 091710 (3pp86).

MITR ★ D22 26761B/14 ★J5 4026-189

Sterilising bag for sterilising medical instruments - prepd. by overlapping sheet of heat-resistant plastic film, thermoplastic layer and nonwoven cloth inner face, and sealing circumference

MITSUBISHI RAYON KK 28.07.77-JA-090565
A92 Q34 (27.02.79) B65d-81/18

Sterilising bag is by overlapping a complex sheet formed by laminating a heat-resistant plastic film and a nonwoven cloth, which has holes > 0.5 mm in dia. penetrating the via a thermoplastic layer which softens or melts at a temp. below the thermal deformation temp. of the heat-resistant plastic film and the perforated non woven cloth, so that the face of the perforated nonwoven cloth becomes the inner face, and hot-press-sealing the circumferential part of the overlapped sheet at a width of > 1 mm.

The heat resistant plastic film and nonwoven cloth are e.g. polyester, polyolefin, nylon, etc., and the thermoplastic layer e.g. polyethylene, polypropylene, etc..

The sterilising bag is useful for the sterilisation of medical instruments by high pressure steam or gas such as ethylene oxide is good at preventing the re-infection by bacteria after the sterilisation. 28.7.77 as 090565 (5pp50).

MITR ★ D22 26762B/14 ★J5 4026-190
Complex sheet for sterilising bag mfr. - is prepd. by laminating heat-resistant plastic film and sheet form fibrous matter with holes via a thermoplastic layer
MITSUBISHI RAYON KK 28.07.77-JA-090564
A92 P73 Q34 (27.02.79) B32b-27/08 B65d-65/40 B65d-81/20

Complex sheet for sterilising bags is prepd. by laminating a heat-resisting plastic film and a sheet-form fibrous matter with holes via a thermoplastic layer which softens or melts at a temp. below the thermal deformation temp. of the heat-resisting plastic film.

The thermoplastic layer is e.g. polyethylene, polypropylene, etc. and the heat-resisting plastic film and sheet form fibrous matter are e.g. polyester, polyolefin, nylon, etc..

The complex sheet is useful as material for sterilising bags used for the sterilisation of medical instruments by high pressure steam or gas such as ethylene oxide. By overlapping the complex sheets so that the face of the sheet-form fibrous matter becomes the inner face and heat-sealing them by melting the thermoplastic layer, the sterilising bag is easily formed, and also heat-sealing of the bag after placing instruments to be sterilised in it can be carried out by hot-pressing. 28.7.77 as 090564 (3pp50).

Adhesive fastener for disposable diaper - has separate backing and facing webs which are foldable to storage position

JOHNSON & JOHNSON 20.10.76-US-734205 (29.09.75-US-617902)

A96 P32 (20.03.79) A61f-13/16

A disposable diaper has adhesive tab fasteners each of which comprises a backing web folded over the edge of the diaper to form first and second anchoring legs which have an adhesive coating on their inner face to permanently adhere to the diaper.

A face web has a fixed end permanently attached to the second leg, and a grippable adhesive-face region at its opposite end. A free working portion is situated between the two ends and this has a layer of pressure-sensitive adhesive on one of its faces. A release area is releasably attached to the adhesive layer on the free working portion.

In the storage position the grippable adhesive-free region extends inwardly away from the lateral margin of the diaper and beyond the release area and the first leg of the backing web. The free working portion is separable from the release area in the non-storage position.

The tab fastener is used to secure the disposable diaper about the waist of an infant. The fasteners remain flat against the diaper in the folded condition and do not interfere with the diaper mfg. machinery. 20.10.76 as 734205 C.i.p. 3987793 (7pp295)

Surface particles adhered to nonwoven web - to improve absorbency, used e.g. as wiper or in disposable diapers

SCOTT PAPER CO 15.10.76-US-732776

F04 P73 (20.03.79) B32b-05/14

Particulate material of less than 48 mesh size is bonded to the surface of a high loft cellulosic fibre web having compressed regions. The particulate material comprises at least 50% of the surface layer and is mixed with the fibres at the interface with the high loft areas. The web has a preponderance of 1.2-6.35 mm fibres of a size which would be retained on a 14 mesh screen.

The particulate layer effectively laterally wicks liquids for absorbtion into relatively dry particulate-free areas. Flooding of pads made from the particulate-surfaced web is thus reduced. 15.10.76 as 732776 (9pp1320)

Antistatic, fabric-softening detergent compsn. - comprising mixt. of quat. ammonium cpd. and dispersion inhibitor particles adhered to detergent compsn. granules
PROCTER & GAMBLE CO 26.09.77-US-836811
E19 F06 (04.04.79) C07c-87 C11d-01/62 C11d-11/02
D/S: E(BE, CH, DT, FR, GB, NL).

Fabric conditioning compsn. comprises (a) 3-40 wt.% of a mixt. of 80-20 wt.% quat. ammonium cpd. (I) and 20-80 wt.% of dispersion inhibitor (II), the mixt. being 10-500 (50-200) μ approx. spherical particles partially embedded in and attached to (b) 97-60 wt.% of spray dried granules comprising 99-5 wt.% surfactant (III) and 1-95 wt.% of a mixt. of 1-100% builder and $\leqslant$ 99% inert, inorganic water-soluble salt.

(I) is of formula $(NR_1R_2R_3R_4)^+Y^-$ (I) (where 1 or 2 of R_{1-4} is/are an organic gp. contg. a 16-22C aliphatic gp. or an alkyl-phenyl or alkyl-benzyl gp. with 10-16C in the alkyl gp., the remaining gps. being 1-4C alkyl, 2-4C hydroxyalkyl, or a 3-8C ring contg. the N atom (or atoms); Y is OH, halide, sulphate, (m)ethylsulphate or phosphate).

(II) is an organic solid of max. water solubility 50 ppm at 25°C and softening pt. 100-200 (150-175)°F and is a paraffin wax, (a)cyclic mono- or polyhydric alcohol, (un) substd. aliphatic carboxylic acid, ester of the acids and alcohols, 3-4C alkylene oxide condensate of any of these, or mixts. thereof. All the mixt. of (I) and (II) has a max. water-solubility of 50 ppm at 25°C and a softening pt. of 100-200°F.

Compsn. imparts antistatic props. The prod. is structurally stable, uniform, does not segregate, allows ready dissolution of the detergent, and maintains the integrity of the softener particles in the wash water. Amts. of (I) needed and wastage of (I) are reduced.
26.9.78 as 200208 (90pp949).
ISR: DT2548242; US3993573; DT2312818; DT2704507.

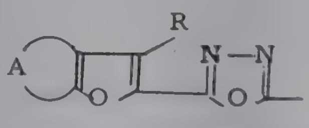
*A60 E23 F06 (F09) (04.04.79) *DT2509-514 C07d-273/02 D06l-01/04 + C07d-307/78*

New benzofuran derivs. (I) are of formula Z-D-Z where Z is a gp. (II) and D is a direct bond or a bivalent aromatic, aliphatic or heteroaromatic bridging gp. which continues the conjugation. Each A is independently a grouping which completes an aromatic mono- or polynuclear ring system which is fused with the furan nucleus, and which may be substd. by$\geqslant 1$ non-chromophoric substit.



Each R is independently H, halogen, lower alkyl, phenyl opt. substd. by$\geqslant 1$ lower alkyl, lower alkoxy and/or halogen substit., carboxy, sulpho or functionally modified carboxy or sulpho The pref. cpds. are those which fluoresce in soln. in the range 410-450 nm.

Cpds. (I) are useful for optically brightening plastics, paper, fibres and textile materials. (I) can be incorporated in soaps and detergents. 5.3.76. as 008976 (17pp927)

FARH D25 61192Y/35 =GB 1543-522
Alkali metal phosphate soln. prepn. - from crude phosphoric acid contg. chromium and vanadium by two-stage neutralisation
HOECHST AG 27.02.76-DT-608[illegible]9
*E34 (04.04.79) *BE-851-825 C01b-25/30*

Prodn. of alkali metal phosphate solns. with an alkali metal oxide to P_2O_5 molar ratio$> 1.9:1$ comprises subjecting wet-processed phosphoric acid contg. $>$ 400 ppm V and$>$600 ppm Cr to stepwise neutralisation using alkali metal hydroxide and/or carbonate by initially neutralising the acid in a first step to give an alkali metal oxide to P_2O_5, molar ratio of 1-1.8:1.

The resulting ppte. in sepd. and the soln. mixed with an Fe (II) salt at elevated temp. Method further comprises neutralising the acid in a second step to adjust the above ratio to$>$1.9:1 and sepg. the resulting ppte. to give an alkali metal phosphate soln. This soln. contains $<$20ppmV (based on P_2O_5) and$<$1 ppm Cr (based on P_2O_5) in the event that the acid is reductively pretreated before the first neutralisation and 5-7.6 ppm Cr (based on P_2O_5) in the even that the acid is not so treated.

The obtd. solns. are used to make condensed alkali metal phosphates, useful in detergents. 18.2.77. as 006922 (6pp992)

Cast blocks for cleaning lavatories - contain hydrophobic agent, surfactant, and opt. disinfectant and dyestuff

CIBA GEIGY AG 18.12.75-GB-051945
A97 E19 (A25) (04.04.79) C11d-01 C11d-03/18

Package prepd. by casting a block for cleaning lavatory bowls or urinals contains (a) 1-95 wt.% $\geqslant$1 hydrophobic agents (I); (b) 5-95 wt.% $\geqslant$1 surfactants (II); (c) 0. 35wt. % $\geqslant$1 compatible disinfectants; and (d)$\leqslant$15 wt.% dyestuff.

(II) is an opt branched alkyl aryl sulphonate, fatty alcohol sulphate, fatty alcohol ether sulphate, fatty alcohol ethoxylate ($>$16 ethylene oxide (EO) units/mol.), polyoxyethylene alkyl phenol ($>$14 EO/mol), fatty acid monoalkanolamide ethoxylate ($>$14 EO/mol), or an EO-propylene oxide copolymer.

The cleaning block may be immersed directly in the H_2O of the cistern to provide a continuous release of cleaning agent. The compsn. has sufficient hardness and consistency to be removed completely from the mould at room temps. by squeezing or tapping the mould. 17.12.76 (4pp478)

JAPC ★ D25 26631B/14 ★J5 4025-286

High purity anionic surfactant with good detergency effect - is di:sodium salt of sulpho:succinic acid mono secondary alcohol ethoxylate ester

NIPPON SHOKUBAI KAGAKU 29.07.77-JA-090400
E12 (26.02.79) C11d-01/29

Anionic surfactant (I) is composed of disodium salt of sulpho-succinic acid-mono-secondary alcohol ethoxylate ester (II), which is prepd. by (1) formation of maleinic acid-monosecondary alcohol ethoxylate ester (III) by the reaction between maleinic acid anhydrate (V) and 8-20 C sec. alcohol ethoxylate (VI), at below 80°C in N_2 stream in the presence of 0.05-5 wt.% of alkali metal-organic acid salt-catalyst, where the ratio of (V)/(VI) is 0.98/1.02 - 1.02/0.98, and (2) sulphonation of (III) by sodium sulphite and/or sodium bisulphate equimolar as (V), at below 80°C and pH 5.5 ± 0.2 in N_2 stream in the presence of water.

Foams can be easily broken. Calcium can be well-dispersed. Detergency is high in spite of low surface tension and low permeability. Solubility is high and the resistance against hydrolysis is high. 29.7.77 as 090400 (11pp42).

HITA ★ D25 26632B/14 ★J5 4025-287

Defoaming agent used in concn. nuclear plant laundry water - comprises silicone oil and emulsifiers of controlled HLB values

HITACHI KK 29.07.77-JA-090296
A97 K07 (26.02.79) B01d-19/04 C02c-05

A defoaming agent (I) is composed of silicone oil (II), an emulsifier (III) and other emulsifier (IV). The HLB of (IV) is higher than that of (III) and the average value of HLB of (III) and (IV) is 7 - 9.

(I) is esp. for defoaming during concentration of laundry water in atomic electric-generating plant, where a large number of working clothes are washed to remove radioactivity. (I) can exhibit high defoaming activity at high temp.

HLB of (III) should be $<$7, e.g. (3.5), and HLB of (IV) should be $>$7. In use (II) normally coagulates gradually and looses its defoaming activity, but in the present compsn. (II) is well-dispersed and the stability of emulsion of (II) is maintained. 29.7.77 as 090296 (4pp42).

NICH- ★ D25 26673B/14 ★J5 4025-

Prodn. of non-foaming detergent compsn. - by mixing chicker faeces soybean meal and rice bran, carbonising, water treatmen and filtering; using filtrate as detergent

NICHIZO KK 29.07.77-JA-091170
(27.02.79) C11d-11

Faeces of chicken, soybean meal, and rice bran are mixed. The mixture is carbonised by fumigating by heating, whereby the air is shut off, to obtain activated carbon. Obtd. activated carbon is dipped in water and filtered. Obtd. filtrate is used as the detergent compsn.

In an example 40 kg chicken faeces, 30 kg soybean meal, and 30 kg rice-bran were charged in a fumigating furnace and the cover of the furnace was closed tightly to isolate from the external air. The furnace was heated to 500-800°C for 4-6 hr. until no fumigated gas was discharged. About 50 kg obtd. activated carbon was dipped in 400 l distilled water for 2-3 days, and the filtrate obtd. by filtering said activated carbon was preserved in a vessel. When the filtrate was diluted and applied to soils resulted from oils or fats, proteins or other organic substances by dipping, brushing, or spraying, the organic substances were decomposed and dispersed. 29.7.77 as 091170 (2pp126).

MANUAL CODE INDEX In Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for r reference.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the **basic patent**, a WPI accession number is assigned, and this is used for all subsequent members of the family

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a **provisional basic.** No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Indexes V and VIII, entries where the basic has a later week number than some of its equivalents.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals
C	Agricultural Chemistry
D	Food, Disinfectants, Detergents
E	General Chemistry
E+	General Chemistry Applns.
F	Textiles, Paper, Cellulose
G	Printing, Coating, Photographic Chemistry
H	Petroleum
J	Chemical Engineering
K	Nucleonics, Explosives, Protection
L	Refractories, Ceramics
M	Metallurgy

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

1977

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnround at low prices. The schedule of prices and turnround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM JUNE 1979.

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, $0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.50, $3.40 or Y890	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.25, $2.80 or Y770	—	Printed copies
JAPAN	4 days	per patent £0.90, or $2.00	—	Photocopies
NETHERLANDS	1 week	per patent £1.45, $3.30 or Y800	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, $0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.20, $1.90 or Y720	11p, 20c or 70Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.60, $3.65 or Y900	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.16, $0.40 or Y100	Minimum charge equivalent to 5 pages	Photocopies
* Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. *				

METHOD OF ORDERING

(i) By books of standard order forms available upon request, or

(ii) By letter, or

(iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

(i) On receipt of bi-monthly invoices, or

(ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

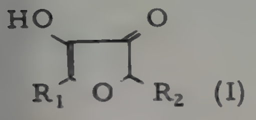
D1: FOOD; FERMENTATION

D11 : BAKING

BOHU/ ★ D11 B/15 ★CS 7707-636
Confectionery products fermentation progress evaluation
BOHUNICKY K 21.11.77-CS-007636
(28.02.79) A21d-02/40

UNIL D11 62885Z/00 =DS 1915-788
2,5-Diethyl-4-hydroxy-2,3-dihydrofuran-3-one - imparts caramel flavour to foodstuffs
UNILEVER NV 28.03.68-NL-004336
*E13 (05.04.79) *BE-730-500 +A21d-13*

The use is claimed of 4-hydroxy-2, 3-dihydro-furan-3-ones of formula (I):-



(I)

(where R_1 and R_2 are (m)ethyl) or their lower acyl esters in enol form, ketals or lower alkyl ethers as organoleptics for baked products in amts. of 0.2-200 (0.5-50)ppm. In particular (I) give a "fresh" taste. 27.3.69 as 915788 (7pp922)

KILI/ ★ D11 27954B/15 ★DT 2741-503
Baking oven hearth plane - with scraper blades and suction connection on hollow metal block
KILIAN T 15.09.77-DT-741503
(05.04.79) A21b-03/16

A plane to clean the hearth of commercial baking ovens consists of a cast iron or steel block with a cavity on one side. A suction tube at the other side can be connected to the suction tube of a large vacuum cleaner. Two of the sides of the block are fitted with adjustable scraper blades which can be raised and lowered in elongated slots. The crust, broken off by the scraper blades, is removed by suction from the oven.

This saves the manual labour of scraping the baking oven hearths clean. 15.9.77 as 741503 (5pp39)

GRUB/ ★ D11 27994B/15 ★DT 2743-217
Dough stretch rolling machine - with two roll stations in common frame above each other
GRUBELNIK H 26.09.77-DT-743217
(05.04.79) A21c-11/06

A dough stretch roller machine for the prodn. of pancake-shaped bread consists of a triple stepped belt conveyor and a feed conveyor for a first roller station and a second triple stepped belt conveyor for the conveyor feeding a second roller station. The roll gap of the second station is adjustable.
